How to buy a personal computer.

Suddenly everyone is talking about personal computers. Are you ready for one? The best way to find out is to read Apple Computer's "Consumer Guide to Personal Computing." It will answer your unanswered questions and show you how useful and how much fun personal computers can be. And it will help you choose a computer that meets your personal needs.

Who uses personal computers.

Thousands of people have already discovered the Apple computer—businessmen, students, hobbyists. They're using their Apples for financial management, complex problem solving—and just plain fun.

You can use your Apple to analyze the stock market, manage your personal finances, control your home environment, and to invent an unlimited number of sound and action video games. That's just the beginning.

What to look for.

Once you've unlocked the power of the personal computer, you'll be

using your Apple in ways you never dreamed of. That's when the capabilities of the computer you buy will really count. You don't want to be limited by the availability of pre-programmed cartridges. You'll want a computer, like Apple, that you can also program yourself. You don't want to settle for a black and white display. You'll want a computer, like Apple, that can turn any color tv into a dazzling array of color graphics.* The more you learn about computers, the more your imagination will demand. So you'll want a computer that can grow with you as your skill and experience with computers grows. Apple's the one.

How to get one.

The quickest way is to get a free copy of the Consumer Guide to Personal Computing. Get yours by calling 800/538-9696. Or by writing us. Then visit your local Apple dealer. We'll give you his name and address when you call.

*Apple II plugs into any standard TV using an inexpensive modulator (not included).

Editorial

Don't Overlook LISP

John R Allen
18215 Bayview Dr
Los Gatos CA 95030

Most programming languages do very little to reinforce the creative process of algorithm discovery and creation. They are more concerned with the execution of already constructed algorithms. This month's guest editorial by John R Allen elaborates on this idea and discusses the relative merits of LISP, along with some general philosophy about personal computing. . . .CPM

Articles Policy

BYTE is continually seeking quality manuscripts written by individuals who are applying personal computer systems, designing such systems, or who have knowledge which will prove useful to our readers. For a more formal description of procedures and requirements, potential authors should send a large (9 by 12 inch, 30.5 by 22.8 cm), self-addressed envelope, with 28 cents US postage affixed, to BYTE Author's Guide, 70 Main St, Peterborough NH 03458.

Articles which are accepted are purchased with a rate of up to \$50 per magazine page, based on technical quality and suitability for BYTE's readership. Each month, the authors of the two leading articles in the reader poll (BYTE's Ongoing Monitor Box or "BOMB") are presented with bonus checks of \$100 and \$50. Unsolicited materials should be accompanied by full name and address, as well as return postage. ■

Pascal has reached critical mass; it has flashed through the mainframe, minicomputer, and now the microcomputer field. It has much to support its popularity; however, it represents but one point of view about computing.

This discussion offers a contrasting position, as "personified" by LISP. I will discuss not relative expressive power or syntax, but rather that the forces and attitudes which shaped the languages (and the kinds of problems which the languages address) represent diverse views of computation. In the 1969 Software Engineering Conference, Niklaus Wirth (creator of Pascal) said:

I would like to discuss the trend towards conversationality in our tools. There has been, since the development of timesharing and on line consoles, a very hectic trend towards development of systems which allow the interactive development of programs. Now this is certainly nice in a way, but it has its dangers, and I am particularly wary of them because this conversational usage has not only gained acceptance among software engineers but also in universities where students are trained in programming. My worry is that the facility of quick response leads to sloppy working habits and, since the students are going to be our future software engineers, this might be rather detrimental to the field as a whole.

Wirth was addressing programming development in particular, but the question of "sloppy work habits" has a broader connotation. Many industrial and educational personnel still question the viability of interactive composition of any kind of text. Supposedly on line composition is wasteful and inefficient; one should carefully think out the text, writing it out in longhand or by typewriter, then revise and amend, cut and

"My Shugart followed me home."

"After working all day with the computer at work, it's a kick to get down to Basic at home. And one thing that makes it more fun is my Shugart minifloppy™. We use Shugart drives at work, so when I bought my own system I made sure it had a minifloppy drive.

"Why? Shugart invented the minifloppy. The guys who designed our system at work tell me that Shugart is the leader in floppy design and has more drives in use than any other manufacturer. If Shugart drives are reliable enough for hard-working business computers, they've got to be a good value for my home system.

"When I'm working on my programs late at night, I can't wait for cassette storage. My minifloppy gives me fast random access and data

transfer. The little minidiskettes™ store plenty of data and file easily too.

"I made the right decision when I bought a system with the minifloppy, when you lay out your own hard-earned cash, you want reliability and performance. Do what I did. Get a system with the minifloppy."

If it isn't Shugart, it isn't minifloppy.

 Shugart

435 Oakmead Parkway, Sunnyvale, California 94086

Here it is at last... **THE FIRST
FLOPPY DISK BASED COMPUTER
FOR UNDER \$1000**

The C1P MF
\$995

- Complete mini-floppy computer system
- 10K ROM and 12K RAM
- Instant program and data retrieval

The Challenger 1P Mini-disk system features Ohio Scientific's ultra-fast BASIC-in-ROM, full graphics display capability and a large library of instant loading personal applications software on mini-floppies including programs for entertainment, education, personal finance, small business and now *home control!*

The C1P MF configuration is very powerful. However, to meet your growth needs it can be directly expanded to 32K static RAM and a second floppy by simply plugging these options in. It also supports a printer, modem, real time clock and AC remote interface as well as the OS-65D V3.0 development oriented operating system

**Or Start with the C1P
CASSETTE BASED
Computer for just \$349.**

The cassette based Challenger 1P offers the same great features of the mini-disk system including a large software library except it has 4K RAM and conservative program retrieval time. Once familiar with personal computers, you'll be anxious to expand your system to the more powerful C1P MF.

You can move up to mini-disk performance at any time by adding more memory and the disk drive. Contact your local Ohio Scientific dealer or the factory today.

*Both systems require a video monitor, modified TV or RF converter and home television for operation. Ohio Scientific offers the AC-3 combination 12" black and white TV/monitor for use with either system at \$115.00 retail.

All prices, suggested retail.

OHIO SCIENTIFIC

1333 S. CHILLICOTHE RD., AURORA, OHIO 44202 (216) 562-3101

Here's how you can be fully computerized for so much less than you thought

BUSINESS — EDUCATION — ENGINEERING — MANUFACTURING

We are pleased to announce the first professional time-sharing system in the microcomputer field.

Naturally, it's from Cromemco.

This new multi-user system will do all of the tasks you usually associate with much more expensive time-sharing computers. Yet it's priced at an almost unbelievably low figure.

Look at these features:

- You can have up to 7 terminals plus a fast, 132-column line printer
- You can have a large system RAM memory that's expandable to ½ megabyte using the Bank Select feature
- Each user has an independent bank of RAM
- You can have floppy disk storage of up to 1 megabyte
- You have confidentiality between most stations
- And, make no mistake, the system is fast and powerful. You'll want to try its fast execution time yourself.

PROGRAMMERS LOVE OUR BASIC

This new system is based on Cromemco's well-known System Three Computer and our new Multi-User BASIC software package.

Programmers tell us that Cromemco Multi-User BASIC is the best in the field. Here are some of its attractions:

- You can use long variable names and labels up to 31 characters long — names like "material on order" or "calculate speed reduction."
- You get many unusual and helpful commands that simplify programs and execution — commands such as PROTECT, LIST VARIABLES, NOLIST, and many more.

- No round-off error in financial work (because our BASIC uses binary-coded decimal rather than binary operation). And we've still been able to make it FAST.
- Terminals and printer are interrupt-driven — no additional overhead until key is pressed.
- The conveniences in this Multi-User BASIC make it much easier to write your own application software.
- A line editor simplifies changes.

BENCHMARK IT — NOW

In the final analysis, the thing to do is see this beautiful new system at your dealer. See its rugged professional quality. Evaluate it. Benchmark it for speed with your own routine (you'll be agreeably surprised, we guarantee you).

Find out, too, about Cromemco's reputation for quality and engineering.

Look into it now because you can have the capabilities of a fully computerized operation much quicker and for much less than you ever thought.

 **Cromemco**
Incorporated
Microcomputer Systems
280 BERNARDO AVE., MOUNTAIN VIEW, CA 94040 • (415) 964-7400

The single card computer with the features that help you in real life

COMPLETE COMPUTER

In this advanced card you get a professional quality computer that meets today's engineering needs. And it's one that's complete. It lets you be up and running fast. All you need is a power supply and your ROM software.

The computer itself is super. Fast 4 MHz operation. Capacity for 8K bytes of ROM (uses 2716 PROMs which can be programmed by our new 32K BYTESAVER[®] PROM card). There's also 1K of on-board static RAM. Further, you get straightforward interfacing through an RS-232 serial interface with ultra-fast speed of up to 76,800 baud — software programmable.

Other features include 24 bits of bi-directional parallel I/O and five on-board programmable timers.

Add to that vectored interrupts.

ENORMOUS EXPANDABILITY

Besides all these features the Cromemco single card computer gives you enormous expandability if you ever need it. And it's easy to expand. First, you can expand with the new Cromemco 32K BYTESAVER PROM card mentioned above. Then there's Cromemco's broad line of S100-bus-compatible memory and I/O interface cards. Cards with features such as relay interface, analog interface, graphics interface, optoisolator input, and A/D and D/A conversion. RAM and ROM cards, too.

Card Cage

32K BYTESAVER PROM card

EASY TO USE

Another convenience that makes the Model SCC computer easy to use is our Z-80 monitor and 3K Control BASIC (in two ROMs). With this optional software you're ready to go. The monitor gives you 12 commands. The BASIC, with 36 commands/functions, will directly access I/O ports and memory locations — and call machine language subroutines.

Finally, to simplify things to the ultimate, we even have convenient card cages. Rugged card cages. They hold cards firmly. No jiggling out of sockets.

AVAILABLE NOW/LOW PRICE

The Cromemco Model SCC is available now at a low price of only \$450 factory assembled (\$395 kit).

So act today. Get this high-capability computer working for you right away.

Cromemco
i n c o r p o r a t e d

Specialists in computers and peripherals

280 BERNARDO AVE., MOUNTAIN VIEW, CA 94040 • (415) 964-7400

The Personal Computer Line by OHIO SCIENTIFIC

C1P: \$349! A dramatic breakthrough in price and performance. Features OSI's ultra-fast BASIC-in-ROM, full graphics display capability, and large library of software on cassette and disk, including entertainment programs, personal finance, small business, and home applications. It's a complete programmable computer system ready to go. Just plug-in a video monitor or TV through an RF converter, and be up and running. 15K total memory including 8K BASIC and 4K RAM — expandable to 8K.

C1P MF: \$995! First floppy disk based computer for under \$1000! Same great features as the C1P plus more memory and instant program and data retrieval. Can be expanded to 32K static RAM and a second mini-floppy. It also supports a printer, modem, real time clock, and AC remote interface, as well as OS-65D V3.0 development disk operating system.

C2-4P: \$595! The professional portable that has over 3-times the display capability of 1P's. Features 32 x 64 character display capability, graphics, full computer type keyboard, audio cassette port, and 4 slot BUS (only two used in base machine). It has 8K BASIC, 4K RAM, and can be expanded to 32K RAM, dual mini-floppies and a printer.

C2-4P MF: \$1599! It's a big personal computing mini-floppy system at a special package price. Contains the famous C2-4P microcomputer with 20K static RAM, 5" mini-floppy unit for instant program and data loading, RS-232 circuitry (for optional modem and printer), and four diskettes featuring exciting games, personal, business and education applications.

C2-8P: \$799! The personal class computer that can be expanded to a full business system. Has all the features of the C2-4P plus an 8 slot BUS (3-times greater expansion ability than the C2-4P). Can be expanded to 48K RAM, dual floppies, hard disk, printer and business software.

C2-8P DF: \$2599! A full business system available at a personal computer price! The system includes the powerful C2-8P microcomputer (32K RAM expandable to 48K), dual 8" floppy unit (stores 8-times as much information as a mini-floppy), and 3 disks of personal, educational and small business applications software. Has all the capabilities of a personal system including graphics plus the ability to perform Accounting, Information Management, and Word Processing tasks for small business. Contact your local Ohio Scientific dealer.

All prices, suggested retail

OF KITCHENS AND COMPUTERS

As a data processing professional of twelve years experience, I have come to have great respect for the principle: "Don't make things more complicated than they are." In particular, this means don't put applications on a computer if they are more easily done some other way, no matter how much you like computers. I refer in particular to Richard Shuford's "Proposal for a Kitchen Inventory System, or Don't Bite the Wand that Feeds You" (December 1978 BYTE, page 184).

An automated food inventory and ordering system might be ideal for a restaurant. Feeding large numbers of people means ordering large amounts of food; the cost of running out of an item, or of overstocking perishables is relatively high. The home kitchen, on the other hand, deals with small quantities of a virtually unlimited number of items. Impulse buying is frequent, and will cause menus to change. The cost of mistakes is fairly small. Automatic reordering is fraught with danger — just when you *finally* use up the last can of cheddar cheese soup (bought in a moment of madness), *shazam*; four more appear.

My own kitchen inventory system works just fine. It is made out of a piece of paper from a legal pad, with the words CHOPIN LISZT (sorry about that) printed across the top, affixed to the door of my refrigerator with a bar magnet. The input device is a number two pencil.

There are thousands of applications which lend themselves to automation very well, and many where nothing else will do — but a computerized shopping list isn't one of them. For computers and computerists to gain the respect (and avoid the enmity) of the rest of the world, we need to be simplifiers, not complicators. So please, don't make things any more complicated than they are!

Bob Brown
Medical Association of Georgia
938 Peachtree St NE
Atlanta GA 30309

The kitchen inventory system may not be every family's cup of tea. My own buying habits are regular enough that the system may help; perhaps yours are not. Impulse purchases do not necessarily disrupt the system. The user may simply choose not to scan a product which is not to be restocked.

In a related communication, Mr Brown advises us that a reprint of "The Characteristics and Decodability of the Universal Product Code" which appeared in the IBM Systems Journal, volume 14, number 1, is available as form G321-5002 for \$0.50 from IBM's General Systems Division offices . . . RSS

COMPUTER HUMOR

Perhaps your readers will enjoy the following bit of doggerel. Every once in a while my husband Pat comes up with a good one like the one below:

*Count Dracula's micro, it seems,
Would trouble his diurnal dreams.
What he felt was, you see,
Inferiority,
For it got all its bytes without screams.*

Leah O'Connor
6315 W Raven
Chicago IL 60646

CONCERNING CHESS AND PASCAL

As a Pascal fanatic who had waited a long time to run across a readable chess program, I was thoroughly delighted to find that the excellent theoretical article "Creating a Chess Player" by Peter Frey and Larry Atkin (October 1978 BYTE, page 182) was to be followed by a complete Pascal listing that put the principles into practice. Having said that, may I be allowed to voice a few minor reservations?

First, although the authors are in general admirably clear about separating machine dependent and machine independent code, I feel they should have made clear that the contorted treatment of bit boards results from a machine dependent implementation restriction: in CDC Pascal, sets may not have more than 59 elements, so that a bit board must be represented as two sets of 32 elements. Other implementations, such as UCSD Pascal, do not have this restriction, so that the bit board manipulations which form the backbone of the program may be represented much more naturally. Thus, IORRS (INRS, INRS, IMRS) could become simply INRS := INRS + IMRS.

Secondly, I find that the program does not exploit Pascal's self-documenting potential as much as it might, because the authors chose a cryptic naming convention instead of using mnemonics. After ten hours of intensive study,

Sol[®]. The small computer that won't fence you in.

A lot of semantic nonsense is being tossed around by some of the makers of so-called "personal" computers. To hear them tell it, an investment of a few hundred dollars will give you a computer to run your small business, do financial planning, analyze data in the engineering or scientific lab — and when day is done play games by the hour.

Well, the game part is true. The rest of the claims should be taken with a grain of salt. Only a few personal computers have the capacity to grow and handle meaningful work in a very real sense. And they don't come for peanuts.

Remember, there's no free lunch.

So before you buy any personal computer, consider Sol[®]. It costs more at the start but less in the end. It can grow with your ability to use it. Sol is not cheap. But it's not a delusion either.

Sol small computers are at the very top of the microcomputer

spectrum. They stand up to the capabilities of mini systems costing four times as much.

No wonder we call it the serious solution to the small computer question.

Sol is the small computer system to do the general ledger and the payroll. Solve engineering and scientific problems. Use it for word processing. Program it for computer aided instruction. Use it anywhere you want versatile computer power!

Build computer power with our software.

At Processor Technology we've tailored a group of high-level languages, an assembler and other packages to suit the wide capabilities of our hardware.

Our exclusive Extended BASIC is a fine example. This BASIC features complete matrix functions. It comes on cassette or in a disk version which has random as well as sequential files.

Processor Technology FORTRAN is similar to FORTRAN IV and

has a full set of extensions designed for the "stand alone" computer environment.

Our PILOT is an excellent text oriented language for teachers.

Sold and serviced only by the best dealers.

Sol Systems are sold and serviced by an outstanding group of conveniently located computer stores throughout the U.S. and Canada.

For more information contact your nearest dealer in the adjacent list. Or write Department B, Processor Technology, 7100 Johnson Industrial Drive, Pleasanton, CA 94566. Phone (415) 829-2600.

In sum, all small computers are not created equal and Sol users know it to their everlasting satisfaction.

Building

Dr Paul R Poduska
 21G Hampshire Dr
 Nashua NH 03060

In response to growing public interest in microcomputing during the past several years, a number of microcomputer kits have been marketed.

The Heathkit H8 microcomputer represents a departure from the S-100 bus design mainstream. It has the full instruction set capabilities of other 8080A systems as well as an innovative, user oriented front panel control subsystem and a 10 position mother board; yet it does not use the type of large power supply found in some larger systems.

It was the kind of design I was hoping for. I was seriously considering the purchase of a computer for some time, and prior to the introduction of the H8, I almost did buy one. But I had a hunch that the Heath Company might resolve some of the design drawbacks that discouraged me from buying other 8 bit kits.

What follows are my experiences, thus far, of building, testing, and running this computer kit. By the time you've finished reading this article you should have a good feel for what the H8 is, what it can do, and how it compares with other kits on the market. In addition, I'll give you a few pointers and short programs that will enable you to take advantage of some of the H8's many features.

Figure 1: The Heath H8 front panel. Many of the 16 keys are multifunctional. The panel allows quick entry of data and programs into the computer. Drawn from a diagram courtesy of Heath Company.

the Heath H8 Computer

Unpacking and Building

My first few evenings with the H8 kit were leisurely spent getting acquainted with the materials and manuals. Opening the 22 lb carton, the first thing that caught my eyes was a loose slip of paper with a notice on it. It warned me to review all of the manuals supplied with the kit before putting anything together, and that if I found it to be too complicated for my knowledge and skill level, I could return it to the Heath Company for a full refund. I know of no other computer kit manufacturer who includes that kind of built-in consumer protection from the outset.

The next items were the sets of manuals and an attractive 3 ring binder to store them in. I had assembled Heathkits before and knew how thorough their documentation has always been; and I had seen some mediocre documentation provided by other companies in the computer kit industry. I found 503 pages worth of assembly and operating manuals which were far superior to any that I had seen on the market.

In all fairness, I don't feel that this point can be overemphasized. Building a microcomputer is not like building a stereo or piece of test equipment. The technology and associated hardware of a computer are unique in many ways. You may have assembled and tested electronic kits before,

but unless you've also assembled digital equipment, you probably won't be an expert on this type of hardware. If you ever need to troubleshoot your computer kit, much of your previous knowledge about *conventional* analog electronics won't be of use. Therefore, *it is important that you know what you are assembling and how to do so correctly.* You don't have to be an electronics wizard to build and operate the H8. Your chances of building a computer kit that works the first time you turn on the power are nearly 100 percent with an H8, due in part to the support services that the manufacturer provides.

After the first few evenings of studying the manuals, I found a reasonably undisturbed space and, with tools in hand, began the first stage of assembly.

The Chassis

Chassis assembly consists of installing the power supply, frame, and several accessories, including a small cone speaker. The frame is made out of heavy sheet metal on the top, bottom and back panel, and structured foam on the sides. The bottom is covered with rows of small holes necessary for the H8's convection cooling system. The ample 10 A power supply is located

A Map of the TMS-9900 Instruction Space

Henry Melton
2511 Dovemeadow
Austin TX 78744

Now that the TMS-9900 16 bit computer is being marketed to the computer experimenter, some easy way to handle its 63,480 individual op codes at a level of "hand assembly" is going to be necessary. The standard method of programming the 16 bit machine involves higher level languages, or at the very least, a good symbolic assembler. The op codes of an 8 bit machine are smaller in number and can be fairly easily memorized by a machine level programmer confined to the limited resources of hand assembly. But nearly every instruction on the TMS-9900 has to be *constructed*, calculated from the instruction's format, depending on the selected options of the moment. That is the essence of the machine's power, but it makes building and analyzing programs at a machine language level difficult. The charts in this article should help simplify the matter.

Organizing One's Approach to a Machine with $2^{15.95}$ Legal Instructions

The first of the op code maps (figure 1) is an expansion of the first byte of a 16 bit instruction. The second map (figure 2) is a detail of the first rank of figure 1. Notice that the most significant digits of the op codes go down and the least significant digits go across the charts. Each block contains the mnemonic of the instruction, the format type of that instruction, and the number of variations (ie: the number of different instructions that the mnemonic represents).

For example, the instruction MOV, for MOVE WORD, has a source and a destination word address, with one of four addressing codes for each, referenced to one of the 16 registers in the workspace for each. That gives 16 times 4 times 16 times 4, or 4096 possible individual instructions. Let's take a specific example. Suppose you come across a C835 instruction in a hexadecimal program dump. You look up that code on the op code space map (figure 1 in this case). It lies in the block for instruction MOV, with an instruction format of I. Comparing C835 with format I in table 1, you find that:

Base op code	= 1100.
Address mode of destination	= 10.
Destination operand register	= 0000.
Address mode of source	= 11.
Source operand register	= 0101.

Since the destination is indexed, the word following the C835 is an address, and thus part of the instruction. The index register, however, is 0000 and the zero register isn't allowed for index mode. Thus the following address *is* the destination address without address modification. If it had been one of the other registers, the following word would have been *added* to the register value to form the indexed address. The addressing mode for the source is register 5, indirect and autoincremented. The source operand's address is in register 5. Once the operand is fetched, the address value in register 5 is incremented by 2 (since it was a word instruction and the 9900 addresses specify *bytes*). Thus the end result of the instruction is that this source operand is moved to the immediate address specified by the word following C835.

"Our inventory is our existence. Think we'd trust it to anything less than Scotch® Brand Diskettes?"

Don Stone, Vice-President,
Mass. Auto Supply Company,
Inc., Boston, Mass.

Scotch Diskettes are the diskettes you can depend upon with the information *your* business depends upon.

Each one is tested and certified error-free before it leaves our factory. Because we know nothing less than perfection is acceptable for *your* vital business data.

Scotch Diskettes are available in regular or mini sizes, compatible with almost any system.

To find out where you can find Scotch Diskettes, call toll free: 800-328-1300. (In Minnesota, call collect: 612-736-9625.) Ask for the Data Recording Products Division.

ANNOUNCING!

the SWITCHBOARD

S-100 I/O INTERFACE

TM

4P+2S+Strobe+Attention+RAM*+EPROM*=\$199

Introducing The SwitchBoard™ I/O Interface, the most complete interface available for S-100 systems... designed by George Morrow exclusively for Thinker Toys™.

The SwitchBoard™ interface provides 4 parallel ports and 2 RS232/TTY serial ports. Plus, strobe and attention ports. Plus, on-board facilities for 4K of optional static RAM and 4K of user-supplied EPROM.

And every port is switch-programmable for total flexibility in interfacing complex peripherals... such as 12-bit daisywheel printers.

Each parallel port can be switched for input or latched output. Both serial ports can be switched to any of 16 baud rates from 110 to 19,200. Each strobe and attention port flip-flop can be switched for pos or neg pulsing.

And yet, The SwitchBoard™ Interface won't hang you up on price or delivery. In kit form, it's just \$199. \$259 assembled. 2114 4K static RAM option (4 MHz Z-80 compatible), \$70.

Ask your local computer shop to place your order immediately for priority shipping. Or, if unavailable locally, order direct from Thinker Toys™, 1201 10th St., Berkeley, CA 94710.

Or call for The SwitchBoard™ at (415) 524-2101 weekdays, 10-5 Pacific Time.

*Sockets provided; chip set optional.

A product of Morrow's Microstuff for
Thinker Toys™

Table 1: Instruction formats of the TMS-9900. This table details the fields of the TMS-9900 instructions and is used in decoding a machine dump once the instruction type has been determined from the two maps of tables 1 and 2.

Type	Bit Number																Number
	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F	
I	Op code			B	Td		D			Ts		S			4096		
II	Op code								Displacement								256
III	Op code					D			Ts		S			1024			
IV	Op code					C			Ts		S			1024			
V	Op code							K			W			256			
VI	Op code								Ts		S			64			
VII	Op code										N			1			
VIII	Op code										N	W		1 or 16			
IX	Op code					D			Ts		S			1024			

B	— Byte or word operation (1=byte)
D	— Destination operand register
S	— Source operand register
W	— Workspace register
Td	— Address mode of destination operand
Ts	— Address mode of source operand
C, K	— Bit or shift count
N	— Unused bits of the instruction. Set to zero.

Address Modes

Td or Ts

00	Workspace register
01	Workspace register indirect
10	Indexed memory
11	Workspace register indirect, autoincrement

Hexadecimal modifiers for the Td (format I) and Ts (formats I, III, IV, VI and IX) fields. To generate an operation code reflecting the given addressing mode, add the hexadecimal values listed in this table:

Addressing Mode	Td	Ts
Workspace register	0000	0000
Workspace register indirect	0400	0010
Indexed memory (symbolic)	0800	0020
Workspace register indirect with autoincrement	0C00	0030

Shifted register or count values for D (formats I, III and IX), C (format IV) and K (format V) fields. In constructing operation codes for these formats, the modifiers for the register or count values indicated are added to the base op code from table 4:

Register or Count	D (C)	K
0	0000	0000
1	0040	0010
2	0080	0020
3	00C0	0030
4	0100	0040
5	0140	0050
6	0180	0060
7	01C0	0070
8	0200	0080
9	0240	0090
10	0280	00A0
11	02C0	00B0
12	0300	00C0
13	0340	00D0
14	0380	00E0
15	03C0	00F0

New from North Star Double Density Performance at Single Density Prices

The new HORIZON computer and Micro Disk System now record in double density! That means each new Shugart SA-400 minifloppy disk drive accesses 180K bytes of on-line information. All double density HORIZON computers and Micro Disk Systems have a redesigned controller which allows the use of quadruple capacity disk drives as they become available in early 1979. A three-drive North Star System with quadruple capacity disk drives will access over a megabyte of on-line information. But, best of all there's no price increase for double density models.

North Star BASIC and DOS have been upgraded to accommodate the increased capacity and yet run existing programs with little or no change. The new disk system also supports single

density, so existing single density diskettes can still be used. Single density SA-400 drives previously purchased with North Star systems can also be used.

Pricing

HORIZON with one double density SA-400 minifloppy (180K bytes), 16K RAM, Z80A processor and serial I/O port: \$1599 kit, \$1899 assembled.

MICRO DISK SYSTEM with one double density SA-400 minifloppy, controller board and power regulation: \$699 kit, \$799 assembled. (Cabinet and power supply \$39 extra each.)

Specifications:

S-100 compatible. MFM encoding, 35 tracks with ten 512-byte sectors per track. 179,200 bytes on double density SA-400 and North Star BASIC, DOS, and Monitor included.

For further information, write for full color catalog or contact your local computer store.

SWPB	VI	06C0	Swap bytes
SZC	I	4000	Set zeros corresponding, word (S AND D)
SZCB	I	5000	Set zeros corresponding, byte (S AND D)
TB	II	1F00	Test CRU bit
X	VI	0480	Execute word as an instruction
XOP	IX	2C00	Invoke extended operation
XOR	III	2800	Exclusive OR

Table 2: Going the other way; this list of the complete TMS-9900 instruction set shows the format and semantics of each operation possible with the machine. The base operation code, in hexadecimal, is modified by arithmetic addition of appropriate codes for details of the instruction as shown in table 1. Thus for example, to generate the code for comparing bytes between two absolute memory addresses this table gives a base op code of 9000 with format I. For the destination address field, a modifier of 800 is added, and for the source address field a modifier of 020 is added, yielding a net instruction value of 9820 for comparing two bytes at arbitrary memory addresses. Information for this table is taken from appendix E of the January 1976 reissue of the TI Model 990 Computer and TMS-9900 Microprocessor Assembly Language Programmer's Guide, document manual number 943441-9701, eliminating operations not applicable to the TMS-9900. ■

HOW TO STAY ON TOP

Controlling Your World

Staying on top means keeping things under control. And, when it comes to staying on top of your applications world, we've got a way for you to do it at low cost.

Whether your particular application is business, professional or scientific systems, you can stay right on top of it with the DYNABYTE DB8/2 microcomputer.

Designed For Value. . .

When we designed the DB8/2, we knew that it had to be a dependable performer in handling large quantities of information. So, every design decision was made with quality and dependability in mind. The DB8/2 is a first-class producer.

For example, it uses two quad density 5.25-inch disk drives with our exclusive Dual Density Disk Controller for up to 1.2 megabytes of formatted storage. That gives you more capacity than two single-density 8-inch drives which means a lower cost per kilobyte. The DYNABYTE DB8/2 is the first microcomputer to offer enough storage capacity on 5.25-inch disk drives to fully utilize CP/M,* the most widely accepted disk operating system.

We also supply and support BASIC, FORTRAN and COBOL programming languages. As for applications, packages include general ledger, accounts receivable, accounts payable, word processing and many other CP/M compatible programs.

. . .For Dependability

We've also built in reliability with edge connectors that meet military specifications and a regulated power supply built to U.L. standards. Your DB8/2 will be cool and dependable.

Before we ship it to you, we conduct factory test and burn-in programs to assure reliability of the entire integrated system.

. . .For You

You'll stay on top through our customer support too. The DB8/2 is completely modular to allow speedy support in the field; and our bonded inventory of all subsystem modules means we can deliver replacement subassemblies overnight to almost anywhere in the U.S..

There's More

The DB8/2 has a 4MHz Z-80 processing module with 10 internal timers, interrupt control, real time clock, one parallel and

two RS232 or current loop serial ports with software selectable baud rates from 110 baud to 76800 baud; 32K of RAM, expandable to 64K without paging and up to 176K with paging; a 12-slot, fully-socketed backplane; preregulated 30 amp power supply.

If you need more storage, our DB8/4 Disk System is the mass storage companion to our DB8/1 microcomputer and includes two 8-inch floppy disk drives in either single or double-sided configuration for up to 2 megabytes of mass storage. Like the DB8/2, the combination of the DB8/1 and DB8/4 features our Dual Density Disk Controller, CP/M, 32K of RAM expandable to 176K, 2 serial I/O Ports and 1 parallel I/O port.

All three systems are designed to help you stay on top.

For more information, call Rick Mehrlich at (415) 965-1010, or see your local computer dealer.

DYNABYTE

Why were all those

scientists of the '30s so mad?

That's easy. Because all they ever got was defective or missing parts, inferior workmanship, and garbled instructions. Sound familiar?

CCS: Here to Deliver

We're California Computer Systems. We'll deliver to you what old Doc ordered and never received. Kits without missing parts. Defect-free workmanship backed by years of solid experience. Quality engineering throughout. And easy-to-decipher support documentation.

Electronics mavericks will appreciate us. We intend to back the true computer hobbyist who wants to do his own S-100 system with everything from a bare metal box to etch and wire-wrap boards suitable for designing original circuits.

For All S-100, TRS-80* & Apple† Users

We can offer memories, I/Os and video products to S-100 users. And both TRS-80 and Apple enthusiasts are represented in our philosophy.

Remember our name—California Computer Systems—and look for our decal on display at a nearby computer store. It's your sure sign of complete satisfaction.

For additional information about CCS or any of its fantastic products, just write:

Race Car for the SR-52

Race Car is a game of skill written for the Texas Instruments SR-52 programmable calculator, in which the player maneuvers a car around a race track drawn on graph paper. The object of the game is to drive the car from the start to the finish line in the best possible time without leaving the track. The program calculates the coordinates of the car based on steering, throttle and brake information entered by the driver. Players can choose to go left, straight or right (relative to the driver's seat), and to accelerate, brake or cruise. Each time the player makes a move, 1 second of time elapses.

For each move, the program calculates the X and Y coordinates of the car's new position and the elapsed time. The player simply plots the car's position and makes the new move based on the present position. Using different colored pens, two or more players can race on the same track and compete for the best finishing time.

The program moves the coordinates of the car during the 1 second time interval based on a velocity vector constructed by the player's decisions. Left and right steering increments are fixed at +15° and -15°, respectively. For example, if you go left, the velocity vector is rotated +15° from its present direction. The acceleration and deceleration constants are +1 division per second² and -1 division per second². If you wish to accelerate, the magnitude of the velocity vector is increased by one and the distance traveled during that move will be one division farther than the previous move. If you decide to cruise, the magnitude of the velocity vector remains constant and the distance traveled during that move will be the same as the previous move.

Text continued on page 30

"If this M-XVI from CCS had been available in the '30s, I would have had the secret of invisibility wrapped up in half the time"

THE INVISIBLE MAN

The place was alive with "mad doctors" 40 years ago. For good reasons. They couldn't get what they wanted. Labs were piled high with incomplete kits, defective gear, and undecipherable support documentation.

All that's history now that California Computer Systems has arrived on the computer hobbyist scene. We'll see that no electronics maverick goes away mad.

Three proofs positive: our new M-XVI Static RAM Module for S-100 bus systems...our new PT-1 Wire-Wrap Board...and our new Soldertail Prototyping Board. The M-XVI features include: fully static design, use of popular 2114 static RAMs, ability to meet IEEE proposed S-100 signal standards, full buffering, addressability in 4K blocks, and bank select by bank port and bank byte. The PT-1 Wire-Wrap Board has all S-100 signals specified and provisions for four regulators. The Soldertail Board has all S-100 signals labelled, provisions for four regulators, and can accept 16-24-and-40 pin spacing.

Take a tip from the Invisible Man. He's quit derailing

trains, robbing banks, and scaring helpless damsels since CCS gave him what he wants. If you're looking for satisfaction, too, check out our new product line today at your nearby computer store.

ALTOS presents a new standard
in quality and reliability

WE'RE ALTOS COMPUTER SYSTEMS. Our SUN-SERIES ACS8000 business/scientific computer creates a new standard in quality and reliability in high technology computers.

HIGH TECHNOLOGY The ACS8000 is a single board, Z80®* disk-based computer. It utilizes the ultra-reliable Shugart family of 8 inch, IBM compatible, disk drives. A choice of drives is available: single or double density, single or double sided. Select the disk capacity you need, when you need it: ½M, 1M, 2M, or 4M bytes. The ACS8000 features the ultimate in high technology hardware: a fast 4 MHz Z80 CPU, 64 kilobytes of 16K dynamic RAM, 1 kilobyte of 2708 EPROM, an AMD 9511 floating point processor, a Western Digital floppy disk controller, a Z80 direct memory access, Z80 Parallel and Serial I/O (two serial RS232 ports, 1 parallel port), and a Z80 CTC Programmable Counter/Timer (real time clock). In essence, the best in integrated circuit technology.

BUILT-IN RELIABILITY The ACS8000 is a true single board computer. This makes it inherently reliable and maintainable. The board and the two Shugart drives are easily accessible and can be removed in less than five minutes. All electronics are socketed for quick replacement. Altos provides complete diagnostic utility software for drives and memory.

QUALITY SOFTWARE Unlimited versatility. The ACS 8000 supports the widely accepted CP/M®** disk operating system and FOUR high level languages: BASIC, COBOL, PASCAL and FORTRAN IV. All available NOW.

PRICE ACS 8000-1, single density, single-sided [½ Mb] \$3,840
ACS 8000-2, double density, single-sided [1 Mb] \$4,500
ACS 8000-3, single density, double-sided [1 Mb] \$4,800
ACS 8000-4, double density, double-sided [2 Mb] \$5,300

Brackets show disk capacity per standard two drive system. All models come standard with 32 Kb RAM and two 8" disk drives as shown above. Expansion to 64 Kb is \$363 per 16 Kb. FPP, DMA, software optional. Dealer/OEM discounts available. Delivery: 30 days ARO, all models.

COMPUTER SYSTEMS

2338A WALSH AVENUE • SANTA CLARA • CA 95050 • (408) 244-5766

Figure 1: A typical route for one player in the game of Race Car, written for the Texas Instruments SR-52 programmable calculator. Players must stay within the bounds of the track (which is arbitrarily drawn on graph paper) or risk disqualification. Increments of change to acceleration and steering are deliberately restricted in order to make the game more challenging, but players have free choices within these limitations.

Remember that you are steering the race car as if you were sitting in the driver's seat, so don't confuse your left and right directions. The degree of difficulty can also be set in the layout of the race track. Hair-pin turns and straightaways will test your skill and make the game exciting. I've had hours of fun racing with my friends and family; I hope you will, too. ■

User Accessible Labels:

A = Left	A _i = X.YT
B = Right	B _i = Vel
C = Cruise	C _i = X.Y Start
D = Accel	D _i = θ Start
E = Brake	E _i = Init

Register Utilization:

00 = P/R conversion
01 = Work area
02 = Work area
03 = Initial X coordinate
04 = Initial Y coordinate
05 = Initial velocity angle
06 = X coordinate
07 = Y coordinate
08 = Angle of velocity vector
09 = Magnitude of velocity vector
10 = Elapsed time
11 = Work area
12 = Work area

Race Car Operating Instructions

- Draw the race track on a suitable piece of graph paper, preferably ten divisions to the inch. Figure 1 shows an example of a typical race track. The race track must be located in the area bound by the lines $X=0$, $X=100$, $Y=0$ and $Y=100$. It is a good idea to leave space between the edge of the race track and the boundaries, since the car might leave the track. Select the combination start and finish line on the track and the initial direction of the car.
- Enter sides A and B of the program.
- Set the D/R switch to D.
- Enter the starting coordinates of the car in the form XX.YY, where XX is the initial X coordinate and YY is the initial Y coordinate. Both numbers must be positive integers between 0 and 100. Press *C.
- Enter the initial direction of the car. This is a positive angle in degrees measured from the positive X axis to the initial direction of the car. This angle should equal $n \times 15^\circ$, where $n = 0, 1, 2, 3, \dots, 23$. Press *D.
- Press *E to initialize the game. The initial X and Y coordinates will be displayed in the form XX.YY000.
- Select the direction in which you will steer the car.

Press A to steer left. Zero will be displayed.
Press B to steer right. Zero will be displayed.

If you want to go straight, skip this step and proceed to step 8.
- Select the throttle and brake conditions.

Press C to cruise.
Press D to accelerate.
Press E to brake.

The position of the car and the elapsed time will be displayed in the form XX.YYTTT, where:

XX = X coordinate of the car.
YY = Y coordinate of the car.
TTT = Elapsed time in seconds.
- Repeat steps 7 and 8 for each move. If the car should leave the track, the player is disqualified. Once the car passes the finish line, the winning time is read from the display.
- To display the magnitude of the velocity vector, press *B'. To return the display back to XX.YYTTT, press *A.
- To play a new game on the same race track, press *E.

North Star Systems Go To Work

More and more, you see the North Star HORIZON computer at work: in business, research, and education. Its high performance qualifies the HORIZON for demanding professional applications. Over 10,000 users during the past two years have proven that North Star hardware has the reliability for day-in, day-out computing. The HORIZON is now a serious candidate for any small system installation.

SOFTWARE IS THE KEY TO HORIZON MATURITY

North Star BASIC and DOS have been used to develop hundreds of commercial program packages. These packages establish that North Star software has the completeness and convenience necessary for serious program development. Because of the many independent vendors offering software using North Star BASIC and DOS, the HORIZON owner now has the widest selection of software in the microcomputer industry! Software available includes: word processing, general ledger, accounts payable/receivable, mailing list processing, inventory and income tax preparation. Program development systems such as assemblers, debuggers, editors, PILOT and FORTRAN are also available.

EXPAND YOUR HORIZON

The basic HORIZON computer includes a Z80 microprocessor, 16K bytes of RAM memory, an I/O interface and one Shugart minifloppy disk drive. The HORIZON can be expanded to 60K bytes or more of RAM, three disk drives, and three I/O interfaces. Performance can be enhanced by the addition of the North Star hardware floating point board. Also, S-100 bus products from other manufacturers may be used to expand the HORIZON.

Files on Parade

Mark Klein
Sanborn Regional School District
Kingston NH 03848

Part 2: Using Files

File Management

In part 1 we discussed the concept of the file. In part 2 we conclude with some practical techniques for using files.

Getting a list of the files on your system is a task you probably perform often. Table 6 is a sample directory (which also appeared in part 1 as table 4a). Notice the command string used to produce the table just above the directory itself. In table 6 the first asterisk is the *prompt*, the computer's signal to enter a command. The letter Q is the Query command, used to produce file directories. The next asterisk is a *wild card* name instead of the file name: it means "give me (a list of) all the files on this device." Finally there is a software switch, /1, specifying floppy disk drive number 1.

Depending on the operating system, wild card characters can also be used. The PerSci controller, for example, allows a command string like:

```
Q FIL???.MPK/1
```

which means:

List [Q] all files on drive number 1 whose extension (version) is MPK, and whose file name begins with the letters FIL, regardless of what the next few letters are.

This article was produced on a text editor and for convenience the different parts were given different file names: FILFIG.MPK held the list of figures; FILCAP.MPK held the figure captions; FILAR1, FILAR2, etc, held text proper. The extension .MPK

identified the files as belonging to me. Thus the command string above would produce a directory listing of all files holding parts of this article.

Using Defaults

If parts of a command string are omitted the operating system automatically inserts a proper type of specification chosen from a preprogrammed list. This preprogrammed list is called the system default specification or just defaults. If the /1 is left off the microcomputer command string in table 6, that system would automatically search for the files on floppy disk drive 0, which happened to be the default device when the directory was made.

Defaults are used as a convenience not just in specifying file devices but also in file names. Large and small timesharing systems usually assign to each user some identifying code number, referred to by terms like account number, user ID, or programmer number. This number is incorporated into the file name, to associate a particular file with a particular user. A common system default lets a user omit this part of the file specification when the user is referencing his or her own files.

Another useful and common kind of default provides extensions to the file name according to the program that produced the file. For example, data files created in Multi-user BASIC have a default extension beginning with .D. Other data files might have an extension .DAT; FORTRAN files could have default extensions .FOR; input files for a macroassembler could be expected to have the extension .MAC; and that assembler might produce binary object files with a default extension of .OBJ.

File Names

T S Eliot understood the complexities of a similar subject when he wrote, in *Old Possum's Book of Practical Cats*, that:

"The Naming of Cats is a difficult matter.

It isn't just one of your holiday games;

Excerpts from "The Naming of Cats" in OLD POSSUM'S BOOK OF PRACTICAL CATS by T S Eliot are reprinted by permission of Harcourt Brace Jovanovich Inc, copyright 1939 by T S Eliot; copyright 1967 by Esme Valerie Eliot.

Table 6: Floppy disk directory generated by microcomputer. This table is repeated from part 1 of this article.

(a)

Position		Significance
F I L E N A M E	1	determines access for all users in same group
	2	determines access for all other users
	3 thru 6	no special significance
•	•	separates name and extension
E X T E N S I O N	7	B → BASIC program; D → data file
	8	group identifier
	9	positions 8 and 9 together form the user's ID

You may think at first I'm as mad as a hatter
When I tell you, a cat must have
THREE DIFFERENT NAMES."

As it is with cats, so it is with files. First, it's good to give a file a family (or group) name. The extension is one place for this, and some of the default extensions make good group names. Properly chosen extensions or family names will allow the use of wild card file names and thus greatly accelerates getting directories of groups of files.

Old Possum can help with the other two names. "First of all," he says, "there's the name that the family use daily." These should be "sensible, everyday names" such as Spacewar, Mastermind, Payroll, Heatplan or Help. They can be plain or fancy, but they must be descriptive. Often these everyday names actually refer to a system of programs, perhaps linked together. The user may not even be aware of this linkage and might refer to this system of programs by its everyday name. "Run the Help program" one user might advise another, without considering or needing to consider that this is really a collection of programs, subprograms and data files.

Finally, a file:

"... needs a name that's particular,
A name that's peculiar, and more dignified. ..."

If each file on a device does not have a unique name there will be serious problems. Further, computer operating systems put stringent restrictions on file names, restrictions necessary if the operating system is to efficiently handle requests dealing with files. A common restriction is the one on the number of characters in a file name. In

(b)

Character	Meaning
6	read, run and update (only useful for virtual arrays)
7	read and run
8	run only
9	run only, but allows program to perform any privileged file operation
any other character	— for group library file, your group, or a public library file: read and run — any other file: no access

Table 7: A multiuser file protection system. Table 7a summarizes the significance of position in the file name. If position 9 is blank, it is assumed to be a group library file. If positions 8 and 9 are blank, a public library file is assumed. Table 7b shows the characters in file names that affect file access when they are used in positions 1 and 2. The number 8 causes the user's storage area to be erased when the program terminates.

TDL's 8 K BASIC, names must be one character. DEC's RT-11 permits six characters, the PerSci controller allows eight, and the latter two provide for additional extensions. Thus keeping the name particular and peculiar requires some thought.

File Protection Systems

Another consideration in choosing a particular and peculiar file name is how it fits into the local file security system. As soon as more than one person begins using a computer system there should be some way of controlling access to files. A simple way is to have users keep their files on their own cassettes or disks. But when user A creates a splendid new program and user B borrows A's cassette to copy the program, problems begin.

It is painful to remember how many times I thought the file I wanted to erase was on drive 0, and the good version was on drive 1.

Physically controlling your media gives good file security, but we often loan out our tapes and disks. Write protecting the media or device helps also, but is often impossible, inconvenient or overlooked. Carefully chosen file names are a further protection. There are several degrees of file access which can be controlled in part on many systems by the file name. These degrees of access might be:

- RUN: allows executing the file.
- READ: allows copying or listing the file.
- UPDATE: allows modifications to the file.

Table 7 partially describes the way to

Note: "Using Files" concludes the 2 part series, "Files on Parade." The table and listing numbering is continued from part 1.

Table 8: Representative file transfer commands from several processors.

Command	Controlling Program	Computer	What Is Being Done
OLD BAGELS	BASIC (most versions)	Micro, PDP-11, etc	The program Bagels is copied from secondary memory (disk) to primary memory.
SAVE B	TDL 8K BASIC	Micro	A program called B is transferred to cassette tape.
L BASIC.TDL/1	PerSci Disk Operating System	Micro	The TDL BASIC interpreter is loaded from floppy disk drive 1 into memory.
SY:9BAGEL.B=CT0:BAGELS.MPK	RT-11 Peripheral Interface Program	PDP-11	A version of Bagels on cassette drive 0 is copied onto the system disk, where it is given the name 9Bagel, and the extension .B.

choose names in Multiuser BASIC to control user access. When working with several files at once, on different devices or media, it is good practice to use procedures similar to those in table 7, and to make sure your file names are uniquely chosen. Mastermind might now have to be called 7MASTR.BAS, but it will still be there tomorrow after others finish using it today.

So choose your file names well. Many times I have seen a programmer who has created a file and is about to name it. He sits in front of his terminal:

“ . . . in profound meditation,
 The reason, I tell you, is always the same:
 His mind is engaged in a rapt contemplation
 Of the thought, of the thought, of the thought of his name:
 His ineffable effable
 Effanineffable
 Deep and inscrutable singular Name.”

[All quotations from “The Naming of Cats,” Old Possum’s Book of Practical Cats, by T S Elliot, Harcourt, Brace, New York, 1939.]

Computer Operation	Microcomputer (PerSci DOS)	Minicomputer (DEC RT-11, PIP)
FILE DELETION	D BAGELS.MPK/1 (delete BAGELS.MPK from floppy drive #1)	CT1: *.MPK/D (delete all files with extension .MPK from cassette drive #1)
DIRECTORY SQUISH	G /1 (“Gap” drive 1)	SY:/S (Squish the system disk)
RENAME	N 9BAGEL.B BAGELS.B	BAGELS.B=9BAGEL.B/R (rename 9BAGELS)

Table 9: Comparison of some microcomputer and minicomputer file house-keeping functions. DEC uses the term squish rather than pack.

Manipulating Files

There are many file operations besides the assembling of directories that are performed at the command level. Most of these operations fit into the general framework of moving a file from one place (device, library, etc) to another. The transfer can be represented symbolically as:

DESTINATION: FILENAME.
 EXTENSION ←SOURCE: FILENAME.
 EXTENSION.

Copying a file from one floppy disk to another, listing a file on a terminal, and moving a file from cassette to primary memory are examples of file transfer. The specific commands vary greatly from system to system, and, even within a system, from one language or utility tool to another. Table 8 illustrates a small selection of these commands.

Deleting a file is also a kind of file transfer; the file is moved to “nowhere.” On a directory device, the directory reference to the deleted file is usually removed; the file itself is probably still on the medium and can often be recovered if its absolute location is known.

Another file transfer operation, the media pack, eliminates gaps on disks and tape due to deleted files, and packs together the remaining files to make room for more. A disk can usually be packed without the use of a second disk drive, but cassettes often require repacking on another medium.

Finally, renaming a file can be thought of as a file transfer within the symbolic format above. The destination and source do not change, but the file name and extension do. Table 9 compares typical minicomputer and microcomputer pack, delete and rename operations.

Now You Can Make Your Own Magic

Unleash the Full Power
of Your
Personal Computer
With the
All-New Aladdin
Personal
Programs™

Aladdin Automation now offers you the magic of a full range of Personal Program™ series especially designed to support the most popular personal computers available today.

Some Personal Programs™ will take you to faraway places of exciting, action-packed adventures. Others will bring fun-filled learning experiences home to you and your child. Still others are designed for your own

use in the home or office.

All Aladdin Personal Programs™ are moderately priced.

Visit your personal computer dealer today to see and experience the magic waiting for you in every one of the Aladdin Personal Programs™. (And if your dealer hasn't ordered his supply yet, then ask him to write Aladdin Automation for complete information on all the Personal Programs™ available now.)

**Welcome To The All-New
World Of Aladdin. And Get Ready
To Make Your Own Magic**

move data pointer within the file	50 RESTORE #2
make the file per- manent; deassign the channel; change the file status	60 CLOSE #2

Table 10: Types of program file control statements. The line numbers used in the examples are to emphasize that these are statements within a program.

File Control

In addition to the file manipulations previously described, there are several kinds of file control statements designed to be part of an application program. Instead of a file handling operation happening in response to a command from the keyboard, using perhaps the monitor system or operating system commands, this second kind of file control happens in response to a program statement. Again, the specific format varies from language to language; unfortunately it also seems to vary within a language like BASIC from manufacturer to manufacturer. However the functions performed in response to these statements are fairly standard. Table 10 is a summary of these functions, with examples from BASIC.

Assigning a unique channel, or data path, to each active file is one way for the operating system to allow simultaneous (or at least parallel) access to several files. Obviously this is necessary in a timesharing system, but it is also convenient for a single user reading text from one file, editing it, and then writing it into an output file. In the first example in table 10, the file 9VISRO is assigned to channel number 2. (The maximum number of channels will depend on the system configuration.)

The file status can be open or closed. Here again the requirements vary from system to system, and within systems according to file access types. The PerSci disk operating system, for example, allows *stream* access regardless of file status. But stream access usually happens at command level. *Rel-*

ative access, used for data base applications, requires a file status of open to store or retrieve file data.

The file mode requirements (input or output) depend on access type too. For this function, though, the distinction is clearer. Once random access files are open, the mode does not usually need to be specified because individual bytes can be changed without touching other parts of the file. However sequential files must be updated as a unit, and therefore a sequential file must generally be set into either input or output (read or write) mode. Remember that input and output refer to the direction of information flow relative to the processor, and not to the storage medium: information comes into the processor from the disk; information goes out of the processor to the disk.

Testing for the end of a file and moving a data pointer within a file are operations characteristic of sequential access files. A random access file has a fixed length, so presumably one knows where the end of it is. Similarly, since individual bytes of a random access file are directly addressable, it is unnecessary to move a data pointer. In practice these functions are performed by program logic statements.

Some kinds of files are more rugged than others; they stand up better to programmer or user abuse. Aborting an information transfer to a sequential file in the midst of the transfer can cause the loss of the whole file, for example. The close command, for both access types, puts a lock on the file door and frees up a data channel, too. Other BASIC program statements (such as CHAIN, END) will often do the same thing. Good programming practice is to do it explicitly, with statements such as CLOSE.

Explicit file initialization is also good practice. Random access files, occupying a specific part of a disk, could contain information left on the disk by a previous program. (Recall that file deletion usually means that the directory entry, not the file itself, is deleted.) At the other end of the line, it is wise to erase a file containing sensitive information when its usefulness is over. These operations can all be done with file control statements in programs.

Programming Techniques Using Files

Whole articles, even whole books, are written to discuss file programming techniques. This final section is not meant to be that comprehensive. Rather, it is a quick dip into the programmer's bag of tricks—a look at some of the methods used to deal with the limitations of smaller systems. The em-

A Beautiful Way To Interface

IQ 140

SOROC's first and foremost concern, to design outstanding remote video displays, has resulted in the development of the IQ 140. This unit reflects exquisite appearance and performance capabilities unequalled by others on the market.

With the IQ 140, the operator is given full command over data being processed by means of a wide variety of edit, video, and mode control keys, etc.

The detachable keyboard, with its complement of 117 keys, is logically arranged into 6 sections plus main keyboard to aid in the overall convenience of operation. For example, a group of 8 keys for cursor control / 14 keys accommodate numeric entry / 16 special function keys allow access to 32 pre-programmed commands / 8 keys make up the extensive edit and clear section / 8 keys for video set up and mode control / and 8 keys control message and print.

Two Polling options available: 1) Polling compatible with Lear Siegler's ADM-2. 2) Polling discipline compatible with Burroughs.

IQ 120

The SOROC IQ 120 is the result of an industry-wide demand for a capable remote video display terminal which provides a multiple of features at a low affordable price.

The IQ 120 terminal is a simple self-contained, operator / computer unit.

The IQ 120 offers such features as: 192 character screen memory, lower case, RS232C extension, switch selectable transmission rates from 75 to 19,200 bps, cursor control, addressable cursor, erase functions and protect mode. Expansion options presently available are: block mode and hard copy capability with printer interface. The IQ 120 terminal incorporates a 12-inch, CRT formatted to display 24 lines with 80 characters per line.

Listing 2: BASIC code for an option choice menu. When the option is chosen, the required code is chained into main memory by line 300.

phasis is on techniques available in versions of BASIC that support named files which can be called from secondary memory devices such as cassettes or floppy disks.

Shortening Program Size

For student programmers at Sanborn Regional High School, where I teach, and especially for students with grandiose plans and unprivileged user numbers, the most frustrating error message is PTB, which means the *program is too big*. There are three file related approaches to this problem that we urge on the students—approaches that fit into our push for modular program design.

First, for programs that have a linear logical flow, we encourage breaking the program into small segments that can be connected by CHAIN statements. A CHAIN statement such as

```
110 CHAIN "WUMPS2.BAS"
```

erases the program currently in main memory (perhaps called WUMPUS.BAS), and replaces it with the program file WUMPS2.BAS. Variables whose values are needed in the second, or chained-to, segment, can be declared in a COMMON statement in the first segment. A typical usage of the CHAIN statement is to segment some long game. The first segment might request information from the user: "Do you want instructions?" If yes, instructions are given; if no, there is a branch directly to the end of segment 1. In either case, the logical flow reaches the end of the first segment, where there is a CHAIN statement to a program file that contains the code for the main body of the game.

A second method works well for application programs that give the user a choice of options. This method puts the *menu* of choices in one program file and each of the various options, or "meals," in separate program files. Listing 2 shows the code for a typical option menu. The menu file and the meals files could be connected by CHAIN statements or by OVERLAY statements.

The OVERLAY statement calls a named program file from secondary memory and "lays it on top of" the program currently in memory. Suppose the original program has a line 100. After the OVERLAY statement in the original program is executed, line 100 in memory will be the one from the overlay file. A line with a number either in the original program or in the overlay file, but not in both, will always be in memory after the overlay.

For the multiple branch logical flow characteristic of the menu and meal method, the decision to use CHAIN or OVERLAY to connect the program files usually depends on how much logic and code can be shared by the various meals. If several of the options utilize the same set of subroutines, or if the options access the same set of data files, it makes sense to use overlay files. Then, in lines that will not be overlaid, the original program can hold the shared subroutines or statements opening and closing the shared data files. If the meals are quite disjoint, and there is little need to pass information back and forth, chaining the segments will increase the modularity of the code.

In either case the goals are to keep the modules small and the interface between them independent of the module used. Smaller segments fit into more machines and are easier to understand. The interface should allow adding options or replacing an option with an improved version without having to modify all of the other options. This plug-in quality facilitates writing code that is easy to change and easy to use.

Data Files

The third technique for using files to achieve modular program design is to separate the data from the program operating on it. An example is the payroll program mentioned in part 1. Another application is to the tutorial, drill and practice, and testing programs used in computer assisted instruction. A common type of program in this group is one that gives a multiple choice quiz. Variety can be added by putting a large bank of questions and accompanying choices in a data file. The main program can then pick five or ten numbers randomly and call

Listing 3: Using a virtual array with Multiuser BASIC. This allows the user to think he is using an array when actually there is a random access device which is holding the bulk of the information.

out the questions and choices matching those numbers to make up a particular test from the file. Using essentially the same kind of programming, the words for the computer's side of a game like Hangman can be kept on a data file.

A slightly more sophisticated method is to use one master program to administer several different multiple choice tests. The user might supply the name of the test, and the program would open the data file containing the appropriate bank of questions. The first word of the data file might hold in-

formation about how many questions are in the file, how many choices per question, how many questions comprise a test, etc. The same master program can handle many different question and answer banks.

Still another type of program can extract information from more than one data file to construct a question. For example, a quiz on chemical formulae can be designed by randomly taking one element name (calcium, aluminum, sodium, . . .) from one file, and another (chloride, sulfide, sulfate, . . .) from a second file.

A common feature of these examples is that space-eating dimensioned arrays are avoided by keeping the data in files, and calling and using only a few elements at a time from a file. When new data is called out, it can be given the same variable name as the previous small group of data. Virtual arrays stored in random access files can be thought of as extensions of this technique. As listing 3 shows, the items in the file can be addressed as if they were part of a dimensioned array in memory. However no dimension statement is necessary in the program, and the programmer has the best of both approaches: access and update as if the variables were in main memory, but space utilization corresponding to their actual

Mass storage for the

Now users of the most popular microcomputers can add truly massive disk storage to their systems with **Micromation's Megabox**. It features dual 8" drives with double density recording to provide over one Megabyte of disk storage. Or you can choose optional double-headed drives to provide over two megabytes. Micromation is a leading supplier of floppy disk systems for micros.

A **TRS-80*** compatible Megabox plugs directly into the TRS-80. This version of Megabox includes provision to add up to 32K of RAM to your TRS-80* system, so you can have up to 4 Megabytes of disk storage and 48K of RAM without an expansion interface. This Megabox brings big system performance to your system at one-third the cost per byte of mini-floppy systems.

Our **SOL*** version of the Megabox installs without modification, and the software is all ready to go. Micromation's double density recording gives you nearly twice the storage of the Helios* at a substantially lower price — and most importantly, you can run CP/M* so you have access to the broadest range of software available in microcomputing.

Combine an **Exidy Sorcerer*** with a Megabox by plugging the controller into the Sorcerer's* S-100 expansion bus. Boot from our Sorcerer* system diskette and you're up and running without any modifications to your hardware or software.

Our **DOUBLER** double density floppy disk controller features true double density recording with a capacity of 512K bytes on each side of the diskette. Doubler systems are easy to install and use. A hardware UART is included on the controller to provide instant system communications. The controller can do a power-on-jump to the on-board PROM bootstrap. And its fast and reliable because the board's hardware includes a phase-lock oscillator and CRC error detection circuitry.

Micromation disk systems are designed to run **CP/M*** the industry standard operating system. You can choose higher level languages such as MBASIC, CBASIC, FORTRAN, COBOL, or PASCAL. And there's a wide selection of business application packages to choose from.

Megabox systems open new opportunities for owners of today's most popular microcomputers. They feature the highest available capacity, performance, and reliability. And they are compatible with your system. But best of all, at \$2295 a Megabox is priced for value. Ask for details at your local computer store or contact Micromation, 1620 Montgomery St., San Francisco, CA 94111 or phone (415) 398-0289.

MICROMATION

The Megabox with 1,000,000 existing software to easily keep a

Circle 223 on inquiry card.

storage on files, an ideal arrangement for a data base.

Files as Buffers

Finally, one more data file technique deserves mention: using files as buffers, as temporary collection boxes for string or numeric information. The names of the elements for the chemistry tutorial and the text for a Help program are examples of data stored in files on a relatively permanent basis. In contrast to this kind of use, files can provide transient storage for data. They might be used as extra workspace for calculations or manipulations like sorts or holding intermediate results.

Perhaps the chemistry tutorial program creates three problems for the student to do at home using random numbers. A file could contain the answers to those problems, to be accessed once the next day when the student checks his or her answers against those in the file. The answers would then be erased.

The list of books or equipment loaned to friends can be placed in the buffer file of a home information program, with items removed from the file as they are returned. Buffer files can also be used to hold mes-

sages taken by a computer interfaced to an automatic answer phone modem, or by a computerized suggestion box (a gripe file), or to hold mail in a computer conference.

Sometime there will be a secondary program to examine, modify, and erase these buffer files. At our high school, for instance, a secondary program reads the gripe file and removes meaningless or obscene comments before the file is posted on the bulletin board.

A Qualification

This article, an introductory tutorial, has skimmed the surface of the concept of files. The richness of file structures and the power of the many techniques have led to varied implementations, only a few of which are illustrated here. Readers are urged to study the manuals for the systems they use both to learn the capabilities of those systems and to find the exact syntax for the techniques described in this article. With respect to file structures and types, microcomputer systems in particular are closer to the Tower of Babel end of the spectrum than they are to any monolithic standard. Now is the time to write about files, to learn about files and to build file systems. ■

Book Reviews

Your Own Computer

by Mitchell Waite and Michael Pardee
 Howard Sams Co Inc
 Indianapolis IN, 1977
 80 pages
 \$1.95

The last three books I read were *Passages*, *Star Wars* and *Your Own Computer*. You see, in between the second and third books a rather futuristic friend loaned me a copy of BYTE, saying, "You won't believe this!"

I didn't. A computer in every home? In department stores? Right now? Being a writer with a science fiction orientation, I was shocked and simultaneously exalted to find that companies were already selling all kinds of low cost home computers, and that perhaps I could buy and use one.

After devouring BYTE in less than two hours, I called my friend and asked him if he knew of any books that explained these personal computers in simple terms, something a nontechnical person like me could understand.

Two days later I went to the local computer store and picked up a copy of *Your Own Computer*, a book that has completely changed my viewpoint about the future of technology. I thanked the universe for being so kind, told my friend, "May the force be with you," and hid myself away for the next day to learn what this home computer thing was all about.

In the preface, the authors informed me that the invention of the personal computer is the most historic event since the automobile, television and transistor combined. This book was designed to remove the stigma of complexity and mystery that surrounds computers, and would probably be my first investment on the road to acquiring my own computer. That made me rather suspicious from the start. How do they know I'll like computers? I might hate them, but I'll admit I was interested.

Chapter 1 was quite interesting. Called "Introduction," it defined what computers

BEFORE YOU BUY COMPUTER #1, VISIT #1 COMPUTERLAND

If the truth is that you want a computer . . . then we want to be your computer store.

We're ComputerLand, the #1 computer store chain in the U.S. What's meaningful about that fact is, that ComputerLand has been chosen by more people as having what they've been looking for. And, since you're looking, let us tell you what you'll find, when you visit a ComputerLand store.

You'll find a product line that's continually evaluated to provide you with the widest and best selection in quality, brand name microcomputers anywhere. You'll find an enthusiastic and knowledgeable staff able to interpret all the equipment specifications, in terms of how they apply to you, and in a way you'll understand. You'll find demonstration areas where you can get a firsthand experience of running a computer yourself.

COMPUTERS FOR BUSINESS

You'll find educational materials to give you a total insight into the world of microcomputers.

You'll find a fully equipped service department to provide whatever assistance is required to keep your computer running in top-notch condition. You'll find computer user's clubs to join, where you can share ideas with people as enthusiastic as yourself. And, with each new visit, you'll find excitement—from the people you deal with, the equipment they offer, and from your own ever-growing personal involvement.

Enough about us. How about what computers do. To attempt to describe all the things your computer might do, would be to describe your imagination. So instead, we'll briefly list some of the many things for which small computers are already being used.

In business, the advent of the versatile and compact microcomputer has put the benefits of computing within reach of small companies. With systems starting at less than \$6000, the businessman can

COMPUTERS FOR THE HOME

computerize things like accounting, inventory control, record keeping, word processing and more. The net result is the reduction of administrative overhead and the improvement of efficiency which allows the business to be managed more effectively.

In the home, a computer can be used for personal budgeting, tracking the stock market, evaluating investment opportunities, controlling heating to conserve energy, running security alarm systems, automating the garden's watering, storing recipes, designing challenging games, tutoring the children . . . and the list goes on.

In industry, the basic applications are in engineering development, process control, and scientific and analytical work. Users of microcomputers in industry have found them to be reliable, cost-effective tools which provide computing capability to many who would otherwise have to wait for time on a big computer, or work with no computer at all.

COMPUTERS FOR INDUSTRY

And now we come to you, which leads us right back to where we started: **If you want a computer, then we want to be your computer store.**

Whether you want a computer for the home, business or industry, come to ComputerLand first. We'll make it easy for you to own your first computer. Because, simply put, we really want your business. When you come right down to it, **that's what makes us #1.**

for the average consumer were like, and where they evolved (a natural evolution of big computers, the further miniaturization of electronic components due to the space race, the development of large scale integration [LSI] by the semiconductor makers, the pocket calculator, the digital watch and the TV game).

Chapter 2, called "Personal Computer Applications," goes into just what personal computers can do for you. Applications for the home, business, classroom and just plain fun are explained, using cartoons for punctuation.

What really impressed me was that one computer could do so many different things. The examples that turned me on the most were: "In the Office," where the computer would automatically display my next appointment while it balanced the company's books; and "Organizing Your Hobby," where the computer would maintain a cross file of my photography collection. I was definitely getting turned on.

The next chapter, "Program for Your Computer," made it clear that it takes a great deal of concentrated thought to write computer programs, and that I probably wouldn't need to know much about programming, since thousands of people were already available to do the programming for me. However, I would need to learn to communicate my needs to a programmer if I wanted to do something special with my computer that wasn't already available from a manufacturer, or someone else. Still, I was assured that most of the programs I would ever want would be furnished by the people who sold me the computer; so the pressure to learn programming apparently was off. That's good because then I began to see a computer as just another consumer product, rather complex but still quite manageable.

In the next chapter, "Nuts and Bolts," I learned what kinds of things make a computer tick. Computers have many hookup parts and equipment. In a way, they are a lot like cameras. Just as camera owners buy lenses and other attachments to enhance the power of their equipment, computer owners may purchase "peripherals" to beef up their systems and give them more flexibility.

Although the authors promised to give me enough information to enable me to walk into any computer store and not be snowed by the equipment, I felt rather rained upon during one such visit. The range of products offered in these computer stores is amazing. I didn't see any two

computers that looked, worked, or even cost the same. However, after I finally started talking to the store owner, I was very glad that I had read the chapter about nuts and bolts. Each time he would show me a particular computer system, I would say something like, "Does it have a software front panel?", or "How much memory and read only memory is there in the minimum system?" My questions seemed to elicit surprise, and I found the owner gleefully explaining everything in fine detail.

One of the nicest things about the nuts and bolts chapter was that I learned about the most often used computer I/O devices: keyboards, video displays, front panels, Teletypewriters, cassette tape mass storage, floppy disk mass storage, etc. Photographs of each device were included.

The final chapter in the book, entitled "Getting Started," explains how one goes about taking the next logical step in understanding, or perhaps even buying, a personal computer. Like the others, this chapter is illustrated with our friendly computer enthusiast trying his luck at learning more about personal computers by going to conventions, reading books and magazines such as BYTE, visiting computer clubs, and of course going to a store.

For me one of the most useful parts of the book was the appendix called "Glossary of Computer Buzz Words." Here I quickly learned the meanings of the crazy words used by computer people. I read the entire glossary from A to X; it was very interesting. Each word was defined and then used in a typical sentence. I memorized a few of these buzz words and used them on the computer store owner. For example, while he showed me a computer game called Star Trek that didn't seem to be working right, I informed him that perhaps his "buffer had overflowed." All I got was a chuckle, and then a sigh.

Well, I finished the book and can honestly say that for someone who previously knew nothing about computers, I really got my money's worth. Besides learning that computers are here to stay, I discovered that the future of home computing is changing fast and furiously. Although delaying my purchase for a few years may save me a lot of money, it will also mean I'll miss out on a whole lot of fun and excitement.

Hands-on microprocessor experience from day one ... The Instructor 50.

Learning by doing is still the best method of education. And when it comes to learning about the world of microcomputers, you won't find a better method than the Instructor 50.

It's the fast, ready-to-use learning device that immediately provides "hands on" experience for gaining microprocessor knowledge—in your home, office, or in the classroom.

Superior to other microprocessor learning aids, the Instructor 50 is a COMPLETE package—including a built-in power supply (50/60 Hz), an LED prompting display, and both functional and hexadecimal keyboards. You also get S-100 compatibility for adding memory and other peripherals. This lets you expand the machine's capability—and your microprocessing applications knowledge. Moreover, you can easily build a program library by recording your own audio cassettes.

The Instructor 50 comes complete with a *Users' Guide*, along with step-by-step instructions for those with no previous microprocessor experience.

Signetics offers one of the broadest choices of microprocessors in the industry. This knowledge stands behind the Instructor 50. When you need to learn about microprocessors, start with Signetics. Start with the Instructor 50. Send for your descriptive brochure today.

We can help you understand microprocessors.

A Microprocessor for

Photo 1: Processing. Photosensitized wafers are exposed with a particular mask pattern using ultraviolet light. The entire environment is otherwise ultraviolet-free.

Photo 2: Breadboard debug. The gate level TTL model of the processor involves ten boards of 80 to 120 integrated circuits each. Many of the required 10,000 connections will be wrong. The system must be tested to find and correct construction and logic errors.

Crowds are not unusual; here we have Don Tietjen, Katy Miller, James Tietjen, Steve Messinger (almost hidden), Mike Shapiro and Bill Keshlear.

Part 3:

Clock Speed

In part 3 we conclude our discussion of the Motorola 6809 processor with some thoughts on clock speed, timing signals, condition codes and software design philosophy for the 6809.

We expect that our logic and circuit design cohorts will be able to get significant production at a 2 MHz bus rate (and possibly faster) with the 6809. But this value alone means next to nothing as a figure of processor merit (we did consider using a very high frequency on chip oscillator so we could win the clock rate race, but decided at the last minute that a resonant cavity would not be acceptable to most users).

Other processors use an internal state machine to implement the required internal operations. These processors frequently require multiple states and multiple clock edges to implement operations which are done in one cycle on 6800 class processors.

The 6800 class machines are all random logic machines with multiple dynamic sequencers. This method of microprocessor design selects a different set of engineering trade-offs as opposed to the state machine approach. In particular, less critical timing is necessary, but suspending the processor for a long time is difficult. We provide two external methods of stopping the machine: \overline{DMAREQ} (which has a maximum asynchronous latency of 1.5 bus cycles, and which will recover the bus from DMA (direct memory access) periodically to allow the dynamic microprocessor to perform a refresh cycle) and \overline{HALT} (which has a maximum latency of 21 cycles, but releases this bus completely).

Signals

The 6809 processor will be made in two versions: the on chip clock version (for small systems) and the off chip clock version (with extra signal lines for additional processor status information). This will allow a cost-effective utilization of pins for each proposed market.

The bus timing signals are E and Q. E is

the Revolution: The 6809

Copyright 1978 by Terry Ritter
and Joel Boney

Final Thoughts

the same as on 6800 systems (previously called $\phi 2$), a square wave clock with a period equal to one bus cycle. Q is the quadrature clock, and leads E by one quarter bus cycle. Good addresses should be available from the processor on the leading edge of Q; data is latched (by the processor or selected memory or peripheral) on the trailing edge of E.

Two signals are used for clock control in the on chip clock version. \overline{DMAREQ} halts the processor internally (and puts the output lines of the processor in the high impedance state using three state circuitry) but allows E and Q to continue to run to provide system clocks for a DMA transfer. MREADY being low extends a memory access in increments of the high frequency oscillator period until MREADY is brought high.

If $BA=0$ (the processor is running) $BS=1$ means that a vector fetch is occurring (IACK). This signal can be used to develop vector-by-interrupting-device hardware that transfers control directly into the desired interrupt handler without polling.

Two signals are available in the off chip clock version to assist in multiprocessor systems. The last instruction cycle (LIC) pin is high during the last execution cycle of any instruction, thus giving bus arbitration a head start. BUSY is high during read modify write, (from the read through to modify) to indicate that memory exclusion is required. Exclusion is required in multiprocessor systems.

Condition Codes

The 6809 condition code flags are the same as those used in the 6800 (N, Z, V and C), and are affected similarly by most operations. Some exceptions are the double byte operations, since the flags are always set to represent the result of the entire operation, whether single or double byte. (This is implied by the fact that both data length operations have the same root mnemonics).

While very simple in concept (the condition flags being mere by-products of arithmetic and logic unit [ALU] operations), their use with various data representations

Photo 3: Plotting the circuit layout. Huge precision plotters display the computer data base which will become the chip. The layout plot is then checked by circuit engineers both for proper interconnection and exact transistor sizing. Any problems thus uncovered will be repaired by editing the data base.

Photo 4: Digitizing. Computer aided design (CAD) technician Lisa Fink enters a cell layout into the data base. The cursor on the light table is used to transfer precision measurements to the computers. An already digitized cell is shown on the video display.

Photo 5: Diffusion. Into the furnace goes another batch of wafers in the process of becoming integrated circuits. Operating near 1000° C, the quartz liner glows incandescent.

and the rich set of conditional branch conditions can seem quite complex. First, we will define the flags as follows.

- N: set if and only if the most significant bit of the result is set (this would be the 2's complement "sign" bit).
- Z: set if and only if all bits of the result are clear (the result is exactly 0).
- V: set if and only if the operation causes a 2's complement overflow. Notice that the expression $(N \oplus V)$ will give the correct sign, even if the sign is not properly represented in the result.
- C: set if and only if the operation causes a carry from the most significant bit (for ADD, ADC) or, set if and only if the operation does not cause a carry from the most significant bit of the arithmetic and logic unit (for subtract-like operations — SUB, SBC, CMP — carry flag represents a borrow) or, set according to rules for rotate or shifts or, set if and only if bit 7 of the

result is set (for MUL).

- Notice that the C flag is not the simple result of the carry in the 8 bit arithmetic and logic unit, but depends on the type of operation performed.
- Notice also that the carry flag represents a borrow after subtract-like operations. This was done on the 6800, for convenience.

Next, let's define the use of the branches. Simple conditional branches:

Test	True	False
Z=1	BEQ	BNE
N=1	BMI	BPL
C=1	BCS	BCC
V=1	BVS	BVC

Signed conditional branches:

Test	True	False
$(N \oplus V) \wedge \bar{Z}=1$	BGT	BLE
$(N \oplus V) =1$	BGE	BLT
Z=1	BEQ	BNE
$(N \oplus V) \vee Z=1$	BLE	BGT
$(N \oplus V) =1$	BLT	BGE

Unsigned conditional branches:

Test	True	False
$\bar{C} \wedge \bar{Z}=1$	BHI	BLS
$\bar{C}=1$	BHS	BLO
$\bar{Z}=1$	BEQ	BNE
$C \vee Z=1$	BLS	BHI
C=1	BLO	BHS

Note: The unsigned branches are not, in general, useful after INC, DEC, LD, ST, TST, CLR or COM.

And finally, the flag results of known conditions of comparison are as follows.

After SUB, SBC, CMP:

- If register is less than memory value (2's complement values) $(N \oplus V)=1$.
- If register is lower than memory value (unsigned values) C=1
- If register is equal to memory value (signed or unsigned) Z=1.

Because some instructions do not (and should not) affect carry, only the equal and not equal branch tests (BEQ, BNE) are useful after these instructions (INC, DEC, LD, ST, TST, CLR, COM) operate on unsigned values. When operating on 2's complement

GOOD BUY, OEM's!

GOOD-BYE COMPETITION!

Since Intertec introduced its new INTERTUBE Video Terminal, a lot of OEM's (and dealers, too) are saying "good-bye" to their high cost, low performance terminals. The INTERTUBE is such a good buy that OEM's find it almost impossible to justify using anything else.

You'll say good-bye too when you compare INTERTUBE's price / performance ratio with any other terminal on the market today. Standard INTERTUBE features include: a 12" display in a 24 line by 80 column format, 128 upper and lower case ASCII characters, reverse video, blinking, complete cursor addressing and control, an 48 key numeric keypad, separate back-space, tab, shiftlock, local, on-line and print keys, special user-defined function keys, protected and unprotected fields, line insert/delete and character insert/delete editing, eleven special line drawing symbols, 15 selectable baud rates from 75 to 9600 BPS, half and full duplex operation, an RS-232 interface, and ... would you believe it ... there is more! A special "Status Protect" key allows you to enable only those features required in your system and "lock-out" all others, thereby assuring flexible operation in both "smart" and "dumb" environments.

By now you're probably becoming very uneasy if your last terminal purchase wasn't an INTERTUBE. Brace yourself. You're going to become sick! OEM's realize there are no hidden costs of ownership with the INTERTUBE. You can have all the performance you need without having to add expensive options. Standard user-oriented features are: an RS-232 printer port, "block" transmission modes, parity and baud rate error detection, a self-test mode, a 25th "STATUS" Line which displays the current status of the terminal, a transparent mode to simplify program debugging, and selectable display intensities for "easy-on-the-eyes" operation with minimized operator fatigue.

Price, performance, design, reliability ... what more could an OEM want? Availability? We've got it! Our new 120,000 square foot manufacturing facility turns out a lot of INTERTUBES each day. And because we control the manufacturing process right down to injection molding our own cover assemblies, your delivery schedules are never interrupted. Order today and chances are your first units will be on their way within 48 hours. Incredible!

Call or write us now. We'll show you what a "good buy" the INTERTUBE really is and why more and more OEM's are saying "good-bye" to the competition.

values, all signed branches are correctly available.

Some Software Design Philosophy

The design of successful software differs from other types of engineering design in that good software can be easily changed, but is exceedingly unforgiving. The creation of working software involves intimate contact with *quality*.

Any program, working or unworking, is a representative of the philosophy of *truth*; the machine will execute the program, good or bad. Only applicable programs are useful, however, and utility is where we encounter quality. Many individuals indoctrinated into a society founded upon truth can scarcely understand why such truthful programs do not work, for isn't one truth just as good as another?

Any program that is to be fixed or changed must be analyzed: the written code must be read and understood. Reading is a problem — most computer languages are very difficult to read simply because so many options are possible from each statement. Finding the coherent design of a program is nearly impossible when, as it is being read, thousands of options exist. It is the paradox of programming that a disciplined, restricted, structured programming language gives programmers

greater freedom to understand their programs.

Consider the analysis of programs: any program segment having multiple conditional branches that cannot be separated must be analyzed for all possible conditions of input data before we can be assured that the program will operate correctly.

Program segments having branch paths that cross may be impossible to analyze rigorously due to the combinatorially larger number of paths that the program may execute. Where control structures are always properly nested, crossed branch paths cannot occur and analysis is easier.

Programming structures which have basically one entry point and one exit are easily detached from surrounding code and are easier to understand and test. This is the fundamental tenet of structured programming.

Every attempt should be made to code in modules. Modules are self-contained entities (usually subroutines) which allocate and deallocate their own local storage. Naturally, the actual code should be heavily commented to allow a reader to understand what is being attempted. But one mark of a good module is that it contains a header block which fully describes *all* aspects of the inputs to the module and results from it. This description should be so detailed as to allow the module to be totally recoded from this information alone. We hope that the description was arrived at *before* the module was written. It is a mark of good software design that the actual coding is but a minor part of the project; it occurs after all modules have been completely described. The finished modules should be individually tested for all possible input values, and should demonstrate that error handlers will operate when a supposedly invalid input value occurs. Modules which are recoded at a later date must pass the original tests.

Software in the Revolution

The microprocessor revolution is fueled by continual technical advancement that produces hardware with ever higher capability and ever lower cost. Yet, it is a requirement of the revolution that software be written to make that cheap hardware *do* anything.

Most present microprocessor software is custom software written for a specific project. Project specific software is rarely published, partly in the (unreasonable) hope of maintaining trade secret protection, and partly because finished project software is rarely of publication quality. Commercial software is rare for a number of reasons:

Photo 6: Wafer probe. Each circuit is separately checked while still on the wafer. This equipment automatically steps to the next chip after any bad result or when all tests are good. A production 6800 is shown.

EPROMs out at the touch of a finger.

After programming a 2708 or 2716 EPROM you won't need a screwdriver to pry it out of SSM's new PBI board equipped with Textool sockets. Just flip the lever and lift it out. And on the same board there are 4 sockets waiting for 2708 or 2716 EPROMs that can be independently addressed to any 4k or 8k boundary above 8000 hex. Two boards in one.

PBI has two separate programming circuits so 2708 or 2716 (5v) type of EPROMs can be programmed without modifying the board. Programming voltage is generated on-board by a DC-DC converter; no need for an external power supply. Programming sockets are Dip Switch addressable to any 4k boundary. And complete software is provided for programming and verifying EPROMs.

With our Magic Mapping™ feature, unused EPROM sockets don't take memory space, so you are never committed to the full 4k or 8k of memory. The board can be configured for 0 to 4 wait states. Use fast or slow EPROMs. All lines are buffered.

The PBI kit is available at over 150 retail locations or directly from SSM for \$139.95 (with Textool sockets) or \$119.95 (without Textool sockets). All SSM kits are backed by a 90 day warranty. Assembled, one year warranty.

SSM manufactures a full line of S-100 boards, including CPU, Video, I/O, RAM, EPROM, Music, Prototyping, Terminator, Extender and Mother boards. For complete details just send for our new, free brochure.

PBI 2708/2716 Programmer & 4k/8k EPROM Board

2116 Walsh Ave., Santa Clara, CA 95050
(408) 246-2707

We used to be Solid State Music. We still make the blue boards.

there must be a market for the (machine specific) software before the investment in program development is made, but the customer base may not exist until good programs are available. It is also difficult to consider investing in software that can be so easily copied (stolen) and used.

The copying problem is not new; musical reproductions have long coexisted with the possibility of consumer recording and reproduction for a close circle of friends. This occasionally happens, but it is usually too much bother to tape the music you want (assuming that the original product is available at a reasonable cost). Software should be distributed as a reasonably priced physical product that is useful to a broad consumer base.

This is an old idea, but it just hasn't worked. The problem is not in the idea, but in the second generation microcomputer architectures which limit the applicability of any particular program read only memory. The 6809 microprocessor is designed specifically — through the use of position independent code, stack indexing, and indirect addressing — to allow the creation of standard program read only memories. This creates a market opportunity for a brand new standard software industry. We knew this when we included these features; you're welcome, entrepreneurs!

Summary

We wrote this series of articles not only to disclose the 6809 but mainly to put down in print the rationale and reasoning behind the 6809. It would have benefited us if the designers of the 6800 had documented their rationale. We would also like to think we have stimulated some interest in the personal computing community for solutions to the software problem and for the study of computer architecture. The big challenge for architects in the next decade and beyond will be to design computers that can effectively utilize the huge number of devices — 1,000,000 transistors by 1985 — that semiconductor technology will be able to put on one 25 mm² piece of silicon.

No computer is designed in a vacuum, and we would like to thank all of our customers and the people at Motorola who gave us valuable input. Special thanks go to the dozens of people — too many to enumerate — who have been or are still actively involved in the design, implementation and production of the MC6809. Without their individual talents and dedication to what seemed to be impossible tasks and impossible schedules, the MC6809 could not have been realized. ■

Event Queue

March 3-4, **Micro-Expo '79**, Texas A and M University Memorial Student Ctr, College Station TX. Sponsored by The Texas A and M Microcomputer Club, the activities at the third annual Micro-Expo '79 will include exhibits by dealers and hobbyists, a programming contest, and a computer chess tournament, as well as seminars on topics of interest to both the novice and the experienced computer enthusiast. Contact Larry Brown at (713) 693-5748 or Scott Edwards at (713) 845-5531.

March 10-11, **Personal Computer Fair**, Pacific Science Ctr, Seattle WA. The fair will acquaint people with personal, home and hobby computer applications. Visitors will see a variety of nontechnical demonstrations and have numerous opportunities for hands-on experimentation. Contact Susan Stocker, Pacific Science Ctr, 200 Second Av N, Seattle WA 98109.

March 17, **The Computer Faire**, Delaware State College, Dover DE. This faire will deal with current technology of computers for the classroom and personal use. Contact Lynda Baker, New Castle County School District Area II, Henry B duPont Middle School, Bengel and Meeting House Rds, Hockessin DE 19707.

March 19-20, **Microcomputers: Operating Principles, Hardware and Software Seminar**, Holiday Inn, Palo Alto CA. Polytechnic Institute of New York and the Institute for Advanced Professional Studies are presenting this 2 day seminar for engineers, programmers, and technical managers involved with selection of microprocessors and design of microprocessor-based systems. The seminar will cover the underlying concepts governing microprocessor operation, architecture, and systems design. Microcomputer elements and their interrelationships will be discussed, emphasizing features important in determining whether a particular microcomputer will be suitable for a given task. Contact Prof Donald D French, Institute for Advanced Professional Studies, 1 Gateway Ctr, Newton MA 02158, (617) 964-1412.

March 19-21, **Federal DP Expo Conference and Exposition**, Sheraton Park Hotel, Washington DC. This fifth annual government show will feature computer related hardware, software and service.

Continued on page 76

The way you check line-by-line with an A P Intra-Switch or Intra-Connector.

You plug your Intra-Switch in-line with standard socket connectors, and instantly you've got a separate, independent on-off switch for each and every line in your flat ribbon cable. To switch, you nudge with a pencil point. It's that quick.

Imagine how much time and trouble Intra-Switch will save you in your diagnostic and quality testing, your programming and selective line inhibiting.

Or, plug in your Intra-Connector (see box) the same way, and you have an extra set of male contacts

at right angles. Instant line-by-line probeability—and an easy way to tap your system and daisy chain it into new areas.

Both Intra-Connectors and Intra-Switches come in 20, 26, 34, 40 and 50-contact models.

Where? At your nearby A P dealer. Where's that? Phone (toll-free) 800-321-9668. And ask for the complete A P catalog, The Faster and Easier Book.

Interrupt Driven Executive operating system features file-and-device-independent, queue-buffered character stream I/O. Linked-file disk architecture, with automatic file creation and allocation for ASCII and binary files, supports sequential and semi-random access disk files. Multi-level file name directory includes name, extension, version, protection and date. Requires 8K RAM at \$A000. Diskette includes numerous utilities \$99.95
- MINIDOS-PLUSX** An easy-to-use DOS for the small computing system. Supports up to 31 named files. Available on ROM or diskette complete with source listing \$39.95

BASIC Interpreters and Compilers

- SUPER BASIC** A 10K extended disk BASIC interpreter for the 6800. Faster than SWTP BASIC. Handles data files. Programs may be prepared using a text editor described below \$49.95
- BASIC BANDAID™** Turn SWTP 8K BASIC into a random access data file disk BASIC. Includes many speed improvements, and program disk CHAINing \$17.95
- STRUBAL+™** A STRUctured BASic Language compiler for the professional programmer. 14-digit floating point, strings, scientific functions, 2-dimensional arrays. Requires 16K RAM and Linkage Editor (see below). Use one of the following text editors to prepare programs. Complete with RUN-TIME and FLOATING POINT packages \$249.95

Text Editors and Processors

- EDIT68** Hemenway Associates' powerful disk-based text editor. May be used to create programs and data files. Supports MACROS which perform complex, repetitive editing functions. Permits text files larger than available RAM to be created and edited \$39.95
- TOUCHUP™** Modifies TSC's Text Editor and Text Processor for PerCom disk operation. ROLL function permits text files larger than available RAM to be created and edited. Supplied on diskette complete with source listing \$17.95

Assemblers

- PerCom 6800 SYMBOLIC ASSEMBLER** Specify assembly options at time of assembly with this symbolic assembler. Source listing on diskette \$29.95
- MACRO-RELOCATING ASSEMBLER** Hemenway Associates' assembler for the programming professional. Generates relocatable linking object code. Supports MACROS. Permits conditional assembly \$79.95
- LINKAGE EDITOR** — for STRUBAL+™ and the MACRO-Relocating assembler \$49.95
- CROSS REFERENCE** Utility program that produces a cross-reference listing of an input source listing file \$29.95

Business Applications

- GENERAL LEDGER SYSTEM** Accommodates up to 250 accounts. Financial information immediately available — no sorting required. Audit trail information permits tracking from GL record data back to source document. User defines account numbers \$199.95
- FULL FUNCTION MAILING LIST** 700 addresses per diskette. Powerful search, sort, create and update capability \$99.95
- PERCOM FINDER™** General purpose information retrieval system and data base manager \$99.95

Cryptography in the Field

Part 1: An Overview

John P Costas PhD
Senior Consulting Engineer
General Electric
Court St, Bldg 4, Rm 38A
Syracuse NY 13201

Cryptography could be described as the science or art of transforming messages into forms that render them unintelligible to outsiders. This is an old and fascinating field and the interested reader could hardly do better than to read a most remarkable book on this subject by David Kahn called *The Codebreakers*.

A few definitions are needed before proceeding. *Plaintext* is the message to be put into secret form. The message, after cryptographic transformation, is known as a *cryptogram*. An authorized individual who is privy to the secrets of the system is said to *decode* or *decipher* the message when converting the cryptogram to plaintext. *Cryptanalysis* is the science or art of extracting the meaning of a cryptogram without the key. *Cryptology* is the science or art encompassing both cryptography and cryptanalysis.

A code is a cryptographic transformation in which no fixed relationship is maintained between the number of symbols in the plaintext and the corresponding cryptographic transformation or *codetext*. An example of a code is shown in table 1. To encode a

message the plaintext word or phrase is found in an alphabetical listing in the encoding section and the corresponding codetext group (in this case 5 digit numbers) is entered into the cryptogram. Note that commonly used words (eg: ballistic) may have more than one codetext equivalent. These are known as *homophones*. There may also be codetext groups that have no plaintext equivalent; these are known as *nulls*. The coding clerk is encouraged to select at random from a group of homophones and also to throw in an occasional null in an effort to frustrate the work of the cryptanalyst.

In the decoding section, the codetext groups appear in their numerical order. The security of a code is enhanced when the codetext numerical order is scrambled relative to the plaintext alphabetical order. When this is done the codebook contains separate encoding and decoding sections. Such codes are known as *2 part* codes. The resulting codetext is often given a further cryptographic transformation (encipherment); the overall process is then known as *superencipherment*.

In many applications, a cipher is preferred to a code. A cipher is a cryptographic transformation in which a fixed relationship is maintained between the number of plaintext symbols and the number of symbols in the resulting cryptographic transformation (ciphertext). An example of a simple cipher would involve replacement of each plaintext letter by the next letter in alphabetical order. Plaintext A becomes ciphertext B, plaintext B becomes ciphertext C, etc. Some feeling for the difference between codes and ciphers may be obtained by noting that linguists are often assigned to break codes while mathematicians handle the ciphers.

This article deals mostly with field ciphers, of which there are two main classifications: substitution and transposition. In the former, new symbols are substituted for the plaintext symbols to form the ciphertext. In the latter, the original symbols are

Encoding			Decoding	
plaintext	codetext	nulls	codetext	plaintext

.
.

Table 1: A simple 2 part code example. The encoding section is alphabetically arranged and the decoding section is numerically arranged. To further frustrate the efforts of anyone intercepting the message, nulls are frequently used (a null is a portion of ciphertext having no plaintext equivalent).

```

key:      P A T R I C I A Z L O T N I K P A T R - - - -
plaintext: M A Y U P B I D P R I C E T W E N T Y - - - -
ciphertext: B A R L X D Q D O C W V R B G T N M P - - - -

```

Table 4: An example of the encryption process using the Vigenère tableau shown in table 3.

method although he did not invent it.) This table is bordered by the plaintext alphabet at the top and ciphertext alphabet designators at the left. The ciphertext alphabets in the body of the table are merely rotations of the normal alphabet. Enciphering is done by writing the key phrase repeatedly over the plaintext and enciphering each plaintext character by the corresponding keyphrase alphabet designator. In the example shown in table 4, letter M is enciphered from alphabet P, letter A is enciphered from alphabet A, letter Y from T, etc. By switching alphabets in this way we frustrate the simple frequency analysis which was so effective in the previous cipher example. Clearly, any given plaintext letter (such as E) has a different ciphertext equivalent in each of the different alphabets.

The cryptanalyst can attack this system by searching for the repeating key length (in this case 15). Once the keylength is established, he or she will rearrange the ciphertext in matrix form in which the row length is equal to the keylength. The columns of this matrix each involve the same ciphertext alphabet. Frequency analysis by columns soon reveals the specific key used and the whole structure then collapses.

One ploy sometimes used to frustrate the cryptanalyst is to use a coherent running key. The key could be taken from a readily available book, for example. By this method, the repetitions of the key are eliminated and the cryptanalyst is forced to work harder for a solution, which he or she can get, given enough cryptogram material and time.

A very significant advance in cryptography was introduced by a concept which may be generally described as *autokey*. In this system, the plaintext itself is used as the key. A given plaintext character selects the

```

key:      P A T R I C I A Z L O T N I K
column order: 11 01 13 12 04 03 05 02 15 08 10 14 09 16 07
             M A Y U P B I D P R I C E T W
             E N T Y P E R C E N T O N T R
             A C T O N E O N L Y

```

Table 5: A transposition table arranged for the keyword Patricia Zlotnik and the example message "May up bid price twenty percent on tract one only." In the transposition method, the keyword is first written out and numbered in alphabetical order. The message is then written in columns under the keyword. The resulting columns are read out in numerical order to produce the ciphertext.

alphabet for encipherment of the next plaintext character, and so forth. One of the problems of using autokey is that the key and the recovered plaintext are one and the same. Thus the system tends to self-destruct after the first error. The error propagation properties of autokey are often cited as the reason for not using this technique in field ciphers.

Transposition Ciphers

An important cipher class is the transposition cipher. As the name implies, the meaning of the message is hidden because the order of the characters is scrambled in the ciphertext. To demonstrate transposition, we again call upon our friend Patricia, but this time her name is written out completely to form the keyphrase. The letters in the keyphrase are then numbered according to alphabetical order. When two or more identical letters exist, they are sequentially numbered from left to right. When this is done, there results a scrambled set of integers from 1 to the number of characters in the keyphrase (in this case 15). The message is then written under these column designators in rows of keyphrase length. An example for the demonstration key and message is shown in table 5.

Once this is done, the ciphertext is read out in column order: ANC, DCN, BEE, etc. When put in the standard 5 letter groups, the cryptogram becomes:

```

A N C D C   N B E E P
P N I R O   T T W R R
N Y E N I   T M E A U
Y O Y T T   C O P E L

```

Since the deciphering clerk knows both the key and message lengths, he or she can quickly determine the length of each column in the original matrix. The cryptogram is then copied in column form and the message read out by rows. Multiple transpositions are often done using the same or different keyphrases. Null cells in the transposition matrix are sometimes used to strengthen the cipher.

Substitution ciphers replace characters but leave them in their original positions. The cryptanalyst can use this invariant to advantage. Transposition destroys the order but does not hide the content. Combinations of transposition and substitution can provide complementing strengths to produce very effective ciphers.

Playfair Cipher

It is interesting to consider briefly an

PASCAL IS ALIVE . . . AND WELL . . . AND WORKING IN A GRAIN ELEVATOR!

When you've decided to let PASCAL work for you, give it the best home—Control Systems' UDS 470.

Our unique PASCAL-IN-PROM feature lets OEM's have their cake and eat it too: the simplicity of assembly-language plus the power of PASCAL. The PASCAL program is compiled (instead of assembled) and the compiler output (P-code) is burned into PROM/EPROM.

Hardware for our rugged UDS 470, designed for hostile environments, has performed successfully for over two years—controlling grain elevator operations in the U.S. and Canada.

Table 6: The two messages shown here were sent by coastwatchers in the South Pacific during World War II. The first message uses "ROYAL NEW ZEALAND NAVY" as the key and the second message uses "PHYSICAL EXAMINATION." These messages follow the Playfair cipher rules except that letter pairs, when falling in a digraph, were left unenciphered.

important contribution to cryptography made by Charles Wheatstone of electrical measurement fame. Reference is made here to the famous Playfair cipher (named, ironically, after the man who enthusiastically promoted Wheatstone and his idea). The ciphertext alphabet is written as in the monoalphabetic example but is reformatted to a 5 by 5 square with I,J occupying the same cell and used interchangeably. Our demonstration key would yield:

```
P A T R I/J
C Z L O N
K B D E F
G H M Q S
U V W X Y
```

Enciphering is done by letter pairs with the following four rules:

- If the plaintext pair falls in the corners of a square, use as the ciphertext the other two corner characters taken in corresponding row order.
- If the plaintext pair falls in the same row, take as the ciphertext the characters immediately to the right of each plaintext character in order. Consider each row to have cylindrical continuation so that the character to the right of the last character in a row is the first character of that row.
- If the plaintext pair falls in the same column, take as the ciphertext the character immediately below each plaintext character in order. Consider each column to have cylindrical continuation so that the character below the last character in a column is the first character in that column.
- Encipher double letters by inserting an X between the letter pair in the plaintext.

Deciphering merely reverses the above procedure. We have here one of those opera-

tions that is quicker to execute than to explain. Using the demonstration keyword square and the demonstration message yields:

```
H T U V A   K T F A I
P N D R X   D L I U I
Q O O K L   I N C R I
P Z R L O   F N C N W
```

This digraphic substitution procedure can be very effective considering its relative simplicity. The reasons for this may be seen from the fact that while there are only 26 characters in the alphabet, there are 676 digraphs (combinations of two letters). The highest letter frequencies are 12% (E) and 9% (T). The highest digraph frequencies are 3¼% (TH) and 2½% (HE). The cryptanalyst thus faces many more entities with a much more uniform frequency distribution in the Playfair than in the character-for-character processing examples given previously.

The Playfair can, of course, be broken, and had the Japanese done this in World War II for the two cryptograms in table 6, the course of contemporary American history might have been radically changed. These cryptograms were sent by coastwatchers in the South Pacific. There is no clear call to action as far as the first message is concerned. However, the reader must surely agree that the second message required immediate action. This is especially true since the Japanese had adequate vessels and troops in the area to resolve the matter without difficulty. Both messages follow the Playfair rules except that letter pairs, when falling in a digraph, were left unenciphered. Even though these messages were (apparently) not deciphered and acted upon, military history is replete with examples in which the course of events was dramatically changed by poor cryptographic practice or by brilliant cryptanalysis. (These messages are taken from the Kahn reference which contains fascinating stories of this type.)

Vernam Cipher

The only cipher generally accepted as being absolutely secure is the invention of an American, Gilbert S Vernam. His system is known in the trade as the onetime key or onetime pad. Some perspective on the contribution made to cryptography by this man may be gained by noting that his system, for which patents were filed in 1918, is the standard system used today, 61 years later, on the Washington to Moscow hot line. Vernam's work involved Exclusive OR operations with a random binary key. An equivalent set of operations is presented

Learn MICROPROCESSOR OPERATION, INTERFACING and PROGRAMMING faster, easier and at less cost with the HEATHKIT® Microprocessor Self-Instruction Program and Computer Trainer

Here's the newest, easiest and lowest-cost self-instruction microprocessor program ever! What's more, it's the fastest way to really learn about this fascinating field with applications in every phase of our everyday lives. From automotive diagnostics to the microwave oven in the kitchen to the computers that are taking on more jobs in the home, schools, government, business and industry every day!

Working with the popular 6800 microprocessor, you'll explore this exciting field using proven self-instruction text materials. You'll learn about micro-computer basics, number systems and codes, computer arithmetic, programming, 6800 capabilities and interfacing and more. With the aid of audio visuals included, you'll go deeper into programming, designing with microprocessors and semiconductor memories. And you'll actually perform a whole series of "hands on" experiments with the optional trainer designed to reinforce the theory you've mastered to that point!

The ET-3400 Trainer kit, designed to accompany your program, features the popular 6800 microprocessor. It is actually a miniature digital computer in itself, complete with a: 1K ROM monitor program; 6 digit LED display for address and data readout; 17-key hexadecimal keyboard for entering programs, data and control; 256 bytes of RAM (expandable to 512 bytes with the chips supplied in the course); breadboarding socket; 8 buffered LED's for display of logic states; 8 SPST switches for binary input plus an on-board power supply with +5, +12 and -12 volt outputs.

The Program comes complete with 62 electronic components, including a 6820 PIA, two 2112 RAM's, a 1406 digital-to-analog converter, 741 and 301 op amps and more. Includes audio visual aids such as an audio cassette, colorful flip charts and programmed learning text material in two deluxe permanent binders.

Complete the optional exam and receive a Certificate of Achievement and 8.0 Continuing Education Units (CEU's) — a nationally accepted means of recognizing participation in non-credit adult education. (Note: Microprocessor Program requires completion of Digital Techniques Program or equivalent knowledge.)

MAIL COUPON TODAY!

MONEY-BACK GUARANTEE!
If you are not 100% satisfied with your Heathkit Program, we will refund the full purchase price of the program text material, less trainer.

FOR THOSE WHO NEED DIGITAL TECHNIQUES TRAINING...

Comprehensive Digital Techniques Program — the background you need to understand computer and modern electronic technology! Digital fundamentals, semiconductor devices for digital applications, Boolean algebra, flip-flops and registers, sequential and combinational logic circuits, digital design and an introduction to computers and more! The program includes programmed instruction text, audio-visual aids, parts for experiments and more. The program includes programmed instruction text, audio-visual aids, parts for experiments and more. Digital Design Experimenter/Trainer lets you perform all the experiments in the program, then develop and test your own projects. Features solderless breadboard sockets, 4 binary data switches, 2 "no bounce" switches to pulse logic circuits, 3-frequency pulse clock generators, 4 LED's for visual indication of logic states plus 3 regulated power supplies. Upon completion of the optional final exam, you receive a Certificate of Achievement and 4.0 Continuing Education Units.

Table 7: When all letters of the alphabet are numbered sequentially, messages may be enciphered and deciphered by adding together the numerical values of the plaintext and the keyword (modulo 26) to obtain the ciphertext. The deciphering process is performed by subtraction.

here except that a different base for the residue arithmetic is used.

Return now to table 3. Let the letters of the alphabet be replaced by the numbers 0 through 25. That is, A = 0, B = 1, C = 2, . . . , Y = 24, Z = 25. When this is done it will be immediately noted that in numerical form each of the ciphertext alphabets is equal to the plaintext alphabet plus the value of the ciphertext alphabet designator, modulo 26. In residue arithmetic all numbers lie in the range of 0 to 1 minus the base value. The base is repeatedly added to or subtracted from any arithmetic result until this range is achieved. For example, alphabet D (value 3) equivalents are obtained by adding 3 to the plaintext or alphabet A values. Once this numerical format is established, tables such as that of table 3 are no longer needed, since encipherment and decipherment may be done as shown in table 7 by simple addition and subtraction. The arithmetic used in this case is modulo 26.

Vernam realized that under heavy traffic loads substitution ciphers all broke down via the Achilles heel of the key, be it repeating keyphrase, coherent running key, or auto-key. His solution to the problem was to generate a truly random key, make two or more copies, and arrange for the used key to be destroyed at both ends of the system after first use. In some cases the key is in paper tape format and a knife is provided at the exit position of the paper tape reader so that the keytape is destroyed automatically as soon as it is read (ie: a onetime tape). In other cases the key is written on pads of paper (digits 0 thru 9, base 10 system) and the sheets of the pad are torn off and destroyed as soon as each is used (ie: a onetime pad).

Trap Door Operations

The bulk of the open literature in the field of cryptography today takes us chronologically to the end of World War II. The state of cryptographic art at that time was

represented by the mechanical and electro-mechanical cipher machines. Some punch card sorting mechanization for cryptanalysis is also occasionally referenced. The security curtain has since fallen, and quite obviously that curtain hid a revolution in cryptography brought about by solid-state digital data processing technology. Until very recently this concrete curtain quietly separated two co-existing computer user groups. The emergence of large commercial data networks and the need for preserving the privacy of data in transmission and storage has resulted in cryptographic work on both sides of that curtain. Topics such as the one reviewed in this section have apparently opened an uneasy dialog between these two groups.

Residue arithmetic, as used by Vernam and demonstrated in the simple example of the previous section, plays a key role in some recent cryptographic techniques that have been disclosed. In these techniques the encryption key (which can be made public) is comprised of a pair of positive integers (E,N). The message is first converted by any consistent means to some integer number M between 0 and N-1. The encryption process is then:

$$C = M^E \text{ (modulo } N) \quad (1)$$

The message number M is raised to the power E, the result is divided by N and the remainder forms the ciphertext number C, which represents the cryptogram. (In one published example, E = 9007 and N is 129 decimal digits in length. This is residue arithmetic with a vengeance!)

The deciphering key (which is kept secret) involves two integer numbers (D,N), and the decryption process is:

$$M = C^E \text{ (modulo } N) \quad (2)$$

The ciphertext value C is raised to the power D, division by N is then done, and the remainder is the original message number M. This can be converted back to alphanumeric format for final delivery.

A 3 step process is used to generate N, D and E.

- Generate two random prime numbers P,Q (of the order of 100 decimal digits each in a practical system) and let $N = PXQ$. Thus N is typically a 200 decimal digit composite number.
- Select number D to be relatively prime to $(P-1) \times (Q-1)$. Any prime number greater than both P and Q is a possible selection.
- Select an E value such that the product $E \times D$ equals unity, modulo the product $(P-1) \times (Q-1)$.

8-INCH FLOPPY DISK SYSTEM

- SE-50 Bus Compatible
- 500K Bytes of Online Storage
- Expandable to 1 Megabyte
- Completely Software Compatible with Existing BFD-68 Mini-Disk Systems

Users that require at least 500K of online data storage will find the LFD-68 floppy system fits the bill. This system uses standard 8-inch floppies to provide this increased capability. The controller provides the capability of supporting up to four 8-inch drives for a maximum system capacity of over 1 megabyte of online storage. This system is complete with system software and available in two configurations. The LFD-68-1, a one drive system and the LFD-68-2, a two drive system.

LFD-68-1 \$1395.00 LFD-68-2 \$1895.00

Users that require at least 500K of online data storage will find the LFD-68 floppy system fits the bill. This system uses standard 8-inch floppies to provide this increased capability. The controller provides the capability of supporting up to four 8-inch drives for a maximum system capacity of over 1 megabyte of online storage. This system is complete with system software and available in two configurations. The LFD-68-1, a one drive system and the LFD-68-2, a two drive system.

LFD-68-1 \$1395.00 LFD-68-2 \$1895.00

Ask about our new DFD-68-2 with two 8-inch double sided floppy disk drives with 512K bytes of storage per drive and capability of adding additional drives to provide over 2 megabytes of online storage.

Users that require at least 500K of online data storage will find the LFD-68 floppy system fits the bill. This system uses standard 8-inch floppies to provide this increased capability. The controller provides the capability of supporting up to four 8-inch drives for a maximum system capacity of over 1 megabyte of online storage. This system is complete with system software and available in two configurations. The LFD-68-1, a one drive system and the LFD-68-2, a two drive system.

LFD-68-1 \$1395.00 LFD-68-2 \$1895.00

This cryptographic process is novel in that knowledge of the enciphering process (E,N) does not reveal the deciphering process (D,N). The terms *one-way* and *trap door* have been applied to such operations. This is to be compared to the cryptographic processes we have been discussing in which knowledge of the key allows one to go in either direction between plaintext and ciphertext with equal ease. Consider now two parties to a transaction: a customer C and a bank B. Let E_c and E_b be the (public) encryption processes of the customer and bank, respectively. Let D_c and D_b be the (secret) corresponding decryption processes.

The customer may take a funds transfer order T in plaintext and apply his secret *decoding* operation to it to produce $D_c(T)$. This transformation may be converted by anyone back to T by applying the public E_c operation. For transmission to the bank, however, the customer encrypts $D_c(T)$ by applying the bank's (public) encryption operation E_b . Thus

$$E_b[D_c(T)]$$

is transmitted to the bank. Interception of the message at this point may be tolerated since only the bank can decipher the E_b operation. Once this is done the bank has $D_c(T)$ to which the bank may easily apply the customer's public encryption operation, E_c , to obtain the plaintext T. That is:

$$T = E_c(D_c(T)) \quad (3)$$

is done at the bank.

Three important features are to be noted. First, the data was protected in transit by the bank E_b operation. The bank is sure of the sender's identity from equation (3) because only c knows the *backward* D_c operation which was applied to T. Also the bank cannot alter T after receipt since $D_c(T)$ stands as verification. The bank cannot produce a $D_c(T')$ to correspond to some altered T' funds transfer order.

The security of these systems is dependent to a great extent on the computational difficulty of factoring the compound number N. It is claimed that this procedure is *computationally infeasible* for sufficiently large values of N using the best algorithms and the fastest computers. (The presentation in this section follows very closely material recently published by R L Rivest and his associates at MIT.)

In part 2 of this article I will discuss program Crypto which performs substitution and transposition. This part shows how a calculator can be converted to a field cipher machine of significant capability. ■

Build your own microcomputer as you learn computer technology at home.

New from NRI! The Most Complete and Up-to-date Home Study Course Ever Offered

As the microprocessor revolutionizes the computer world and microcomputers appear almost everywhere, NRI brings you a new, convenient, and effective way to keep up with this expanding technology. It's NRI's Computer Technology Course, created and designed exclusively for learning at home in your spare time.

Featuring NRI's Exclusive Dual Language Microcomputer

NRI goes beyond book learning to give you practical, "hands-on" experience in designing circuitry, interfacing components, programming, and troubleshooting. As you learn, you actually assemble NRI's designed-for-learning microcomputer, incorporating the latest advances in the state of the art. It looks and operates like the finest of its kind, actually does more than many commercial units. But NRI engineers have designed components and planned assembly so it demonstrates important principles, gives you working experience in detecting and correcting problems. And it's yours to keep, put to work in your own home or business.

You also build and keep your own test instruments, including a transistorized volt-ohm meter and CMOS digital frequency counter. And NRI's Discovery Lab[®] broadens your horizons with specialized experiments and theory demonstrations.

The Proven Way to Learn at Home

You don't have to worry with travel, classes, or time lost from work when you learn the NRI way. As they have for more than 60

years of teaching technical subjects, NRI brings the material to you. You study in your spare time, at your convenience, using "bite-size" lessons that program material into logical segments for easier assimilation. You perform experiments and build equipment using kits we supply. And your personal NRI instructor is always available for consultation should you have questions or problems. Over a million students have already shown the effectiveness of NRI training.

Choice of Courses

Several courses are available, depending

upon your needs and background. NRI's Master Course in Computer Technology starts with the fundamentals, explores basic electronics and digital theory, the total computer world, and the microcomputer. The Advanced Course, for students already versed in electronics and general computers, concentrates on the microprocessor and microcomputer. In both courses, you build all instruments and your own computer.

Send for Free Catalog... No Salesman Will Call

Get the details on these exciting new courses in NRI's free, 100-page catalog. Shows all kits and equipment, lesson outlines, and full information, including facts on other electronics courses. Mail the coupon today and we'll rush your catalog. No salesman will ever call. Keep up with the latest technology as you learn on your own computer. If coupon has been removed, write to NRI Schools, Computer Department, 3939 Wisconsin Ave., Washington, D.C. 20016.

The Standard Data Encryption Algorithm

Part 1: An Overview

Robert V Meushaw
4188 Brittany Dr
Ellicott City MD 21043

Recently, I have seen many articles describing new commercial encryption equipment using the Standard Data Encryption Algorithm. There have also been recent announcements of integrated circuits, like the Intel 8294, which implement the standard. The Standard Data Encryption Algorithm has been published by the National Bureau of Standards for use in the protection of computer data. The algorithm is described in FIPS Publication 46, available from the US Department of Commerce. After months of being bombarded with publicity regarding the encryption method, it finally struck me that I had found a perfect project for my KIM. The challenge became to implement the algorithm with the basic memory provided and to achieve sufficient processing speed to make it practical for use by others. Along the way, I hoped to investigate the advantages and disadvantages of the 6502 in performing the necessary tasks.

Cryptography Basics

Cryptography involves the use of a scheme to transform intelligible text into an unintelligible form and to later recover the original text. The transformation process is known as *encryption* and the recovery process is known as *decryption*. Cryptographic techniques have been used for centuries to allow individuals to communicate without fear of outsiders discovering what they are saying. The individuals who communicate generally possess a cryptographic *key* which

controls the encryption and decryption process. Unless someone knows the key used to encrypt the data, he or she will not be able to correctly decrypt the data. The number of possible keys is usually made so large that it is impractical to try decrypting the data using all key possibilities. It must be clear that the critical factor in protecting the data is the secrecy of the key used.

The cryptographic technique employed in the Standard Data Encryption Algorithm is known as a *codebook*. In this case, a 64 bit block of data is transformed to a corresponding 64 bit block of data known as a *cipher*. Each time a particular set of data is provided as input, the same cipher will result: assuming the same key is used. The Standard Data Encryption Algorithm uses a 56 bit key to control the encryption. As mentioned before, this was chosen to give a large number of possible keys (ie: 2^{56}). Some estimates have been made that it would require, on the average, approximately 2500 years on a general purpose computer significantly faster than a CDC 7600 to examine all 2^{56} (ie: 7.2×10^{16}) possible keys in order to determine the particular key used to encrypt a block of data.

Restrictions

The National Bureau of Standards position on the implementation of the Standard Data Encryption Algorithm is that software implementations are not in compliance with the standard. The standard, however, applies to use on federal systems, not private com-

puters. If you have any reservations concerning your intended use of this method, check the applicable regulations.

Algorithm Overview

A very simple diagram of the operations involved in the encryption algorithm is shown in figure 1. The input (plaintext) is first subjected to an initial permutation operation, which reorders the bits. Most of the work of the encryption is done in the box labeled product transformation. Details of this transformation will be described later. The block transformation is a simple exchange of the left and right 32 bits of data. The last step is a permutation operation which is the inverse of the initial permutation operation. The output of this step is the ciphertext.

In case you're wondering where the key comes in, it is the controlling factor in the product transformation. Note also the relationship of the initial permutation to its inverse. The fact that they are inverses means that if you perform an operation using a function and then reorder again using the inverse of the function, the result will be the original word. Of course the same thing occurs if the inverse and then the function is applied to the word. Tables 1a and 1b show the permutation tables for the initial permutation and its inverse. The permutation operation should be interpreted as follows: proceeding from left to right, bit 1 of the permuted word is bit 58 of the input, bit 2 of the permuted word is bit 50 of the input, etc. I was originally confused about the numbering scheme chosen for the bits, since I was accustomed to bits being numbered 0 thru 7 going from right to left. The correspondence between the Standard Data Encryption Algorithm numbering scheme and typical computer numbering is depicted in figure 2.

Algorithm Operation

A more detailed diagram of the encryption algorithm is provided in figure 3. The basic operations are quite straightforward. What is shown is basically an expansion of the product transformation box from figure 1.

Let's look at the basic operations involved after the initial permutation. The 64 bits of permuted input are split into two groups of 32 bits each, called left (L) and right (R). The subscripts on L and R indicate the iteration of the algorithm. The first thing that occurs is the generation of K1. K1 is known

Figure 1: An overview of the Standard Data Encryption Algorithm.

Table 1: Permutation tables for the initial and inverse initial permutation (1a and 1b respectively). The initial permutation table is read as follows: bit 1 of the input goes to bit 58 of the output, bit 2 of the input goes to bit 50 of the output, etc.

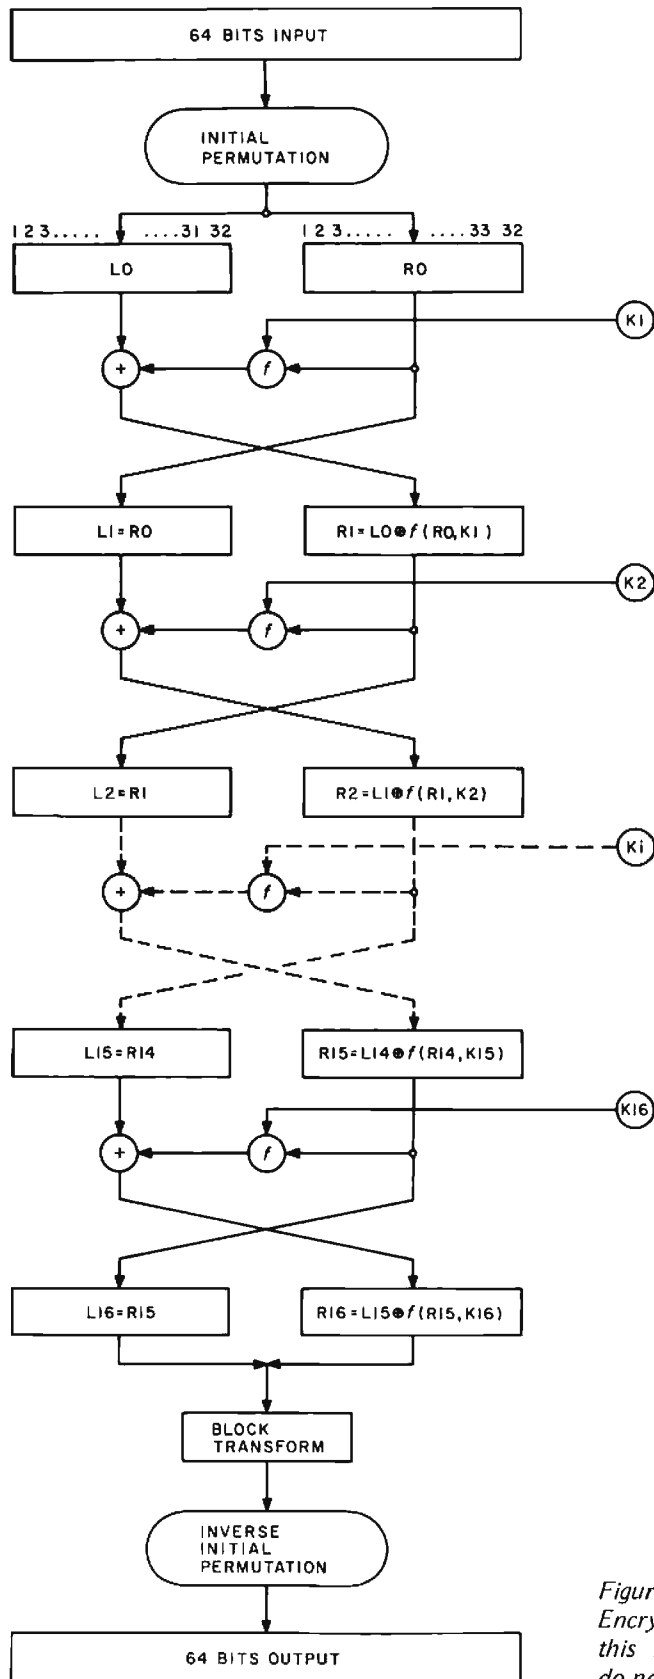

Figure 2: Corresponding numbering between the Data Encryption Standard and typical microcomputer bit numbering.

PLAINTEXT

CIPHERTEXT

as the *subkey*, and is generated directly from the encryption key. In fact, each K_i is generated from the key. Don't worry yet about exactly what each K_i is or where it comes from -- that will soon be explained. A function, $f(R_0, K_1)$, is now generated using K_1 and R_0 as inputs (again, the details will be explained shortly). The next operation is the modulo 2 addition (ie: exclusive OR) of $f(R_0, K_1)$ to L_0 . Therefore, $L_0 \oplus f(R_0, K_1)$ replaces the old L_0 . Finally, the current leftmost 32 bits are exchanged with the current rightmost 32 bits. This completes one iteration of the algorithm and involves all the basic operations. To complete the product transformation, the steps above are repeated as shown in figure 3. The encryption process is completed by performing the block transformation and the inverse initial permutation operation.

An important fact about the modulo 2 addition step is that it is reversible. This reversibility allows the decryption process to recover the original plaintext. In fact, as I will show, you can use the same algorithm steps to do the decryption as you used for encryption.

Something for Nothing?

In case my arguments of the simplicity of the Standard Data Encryption Algorithm haven't convinced you, I should point out that it wouldn't be fair to expect 2500 years of protection from an algorithm which wasn't somewhat involved. Figures 4a and 4b provide illustrative examples of the encryption and decryption processes. I have used only two iterations in the product transformation, but the principle is the same for 16 iterations. Note in particular how the same algorithm is used for decryption, except that the subkeys are applied in reverse sequence. In figure 4b, the results of each transform are shown after the modulo 2 addition. For example, the first transform results of L_1 are obtained by computing $R_2 \oplus f(L_2, K_2) = [L_1 \oplus f(R_1, K_2)] \oplus f(R_1, K_2) = L_1$. Remember how modulo 2

Figure 3: A detailed operation of the Standard Data Encryption Algorithm encryption process. Note that this flow diagram (and the following flow diagrams) do not use standard flowchart symbology.

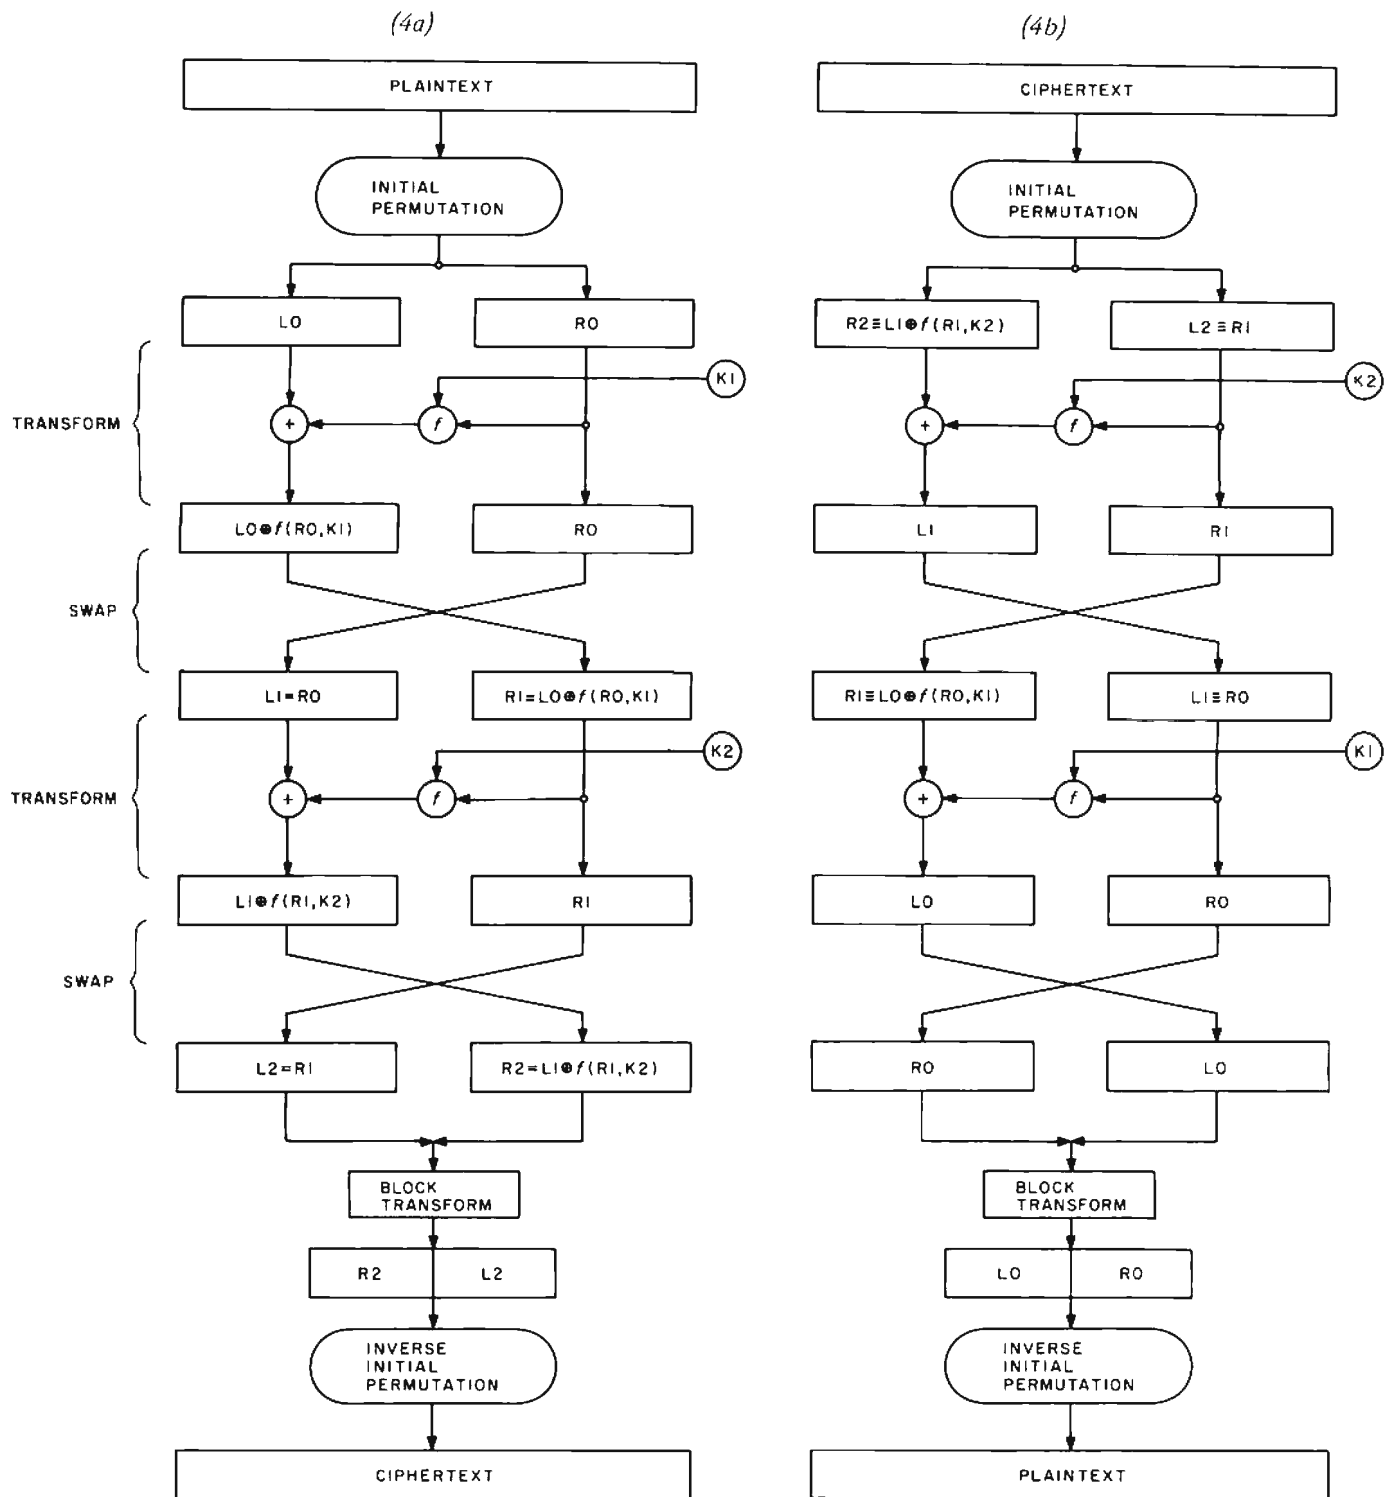

Figure 4: A simplified encryption and decryption process using the Standard Data Encryption Algorithm. Figure 4a shows a plaintext message being processed into a ciphertext and figure 4b shows the inverse process. Although only two iterations of transformation and swapping are shown, 16 are actually performed.

addition works. Following the decryption through figure 4b, you can see how the encryption steps are reversed. The result is the original plaintext.

Algorithm Details

In order to program the encryption algorithm, it is necessary to understand the details of two operations that I have alluded to. The first is the generation of the subkeys K_1, K_2, \dots, K_{16} ; the second is the generation of the function $f(R, K)$.

Subkey generation is depicted in figure 5. The process starts with the 64 bit key that you provide for the encryption. Actually, only 56 of these bits are used; the remaining eight can be used as parity bits. The first transformation of the key is called permuted choice 1. Permuted choice 1 permutes the 56 bit key and also regroups it into two 28 bit words, called C_0 and D_0 . The generation of subkey K_1 is done by circular shifting both C_0 and D_0 left and then permuting

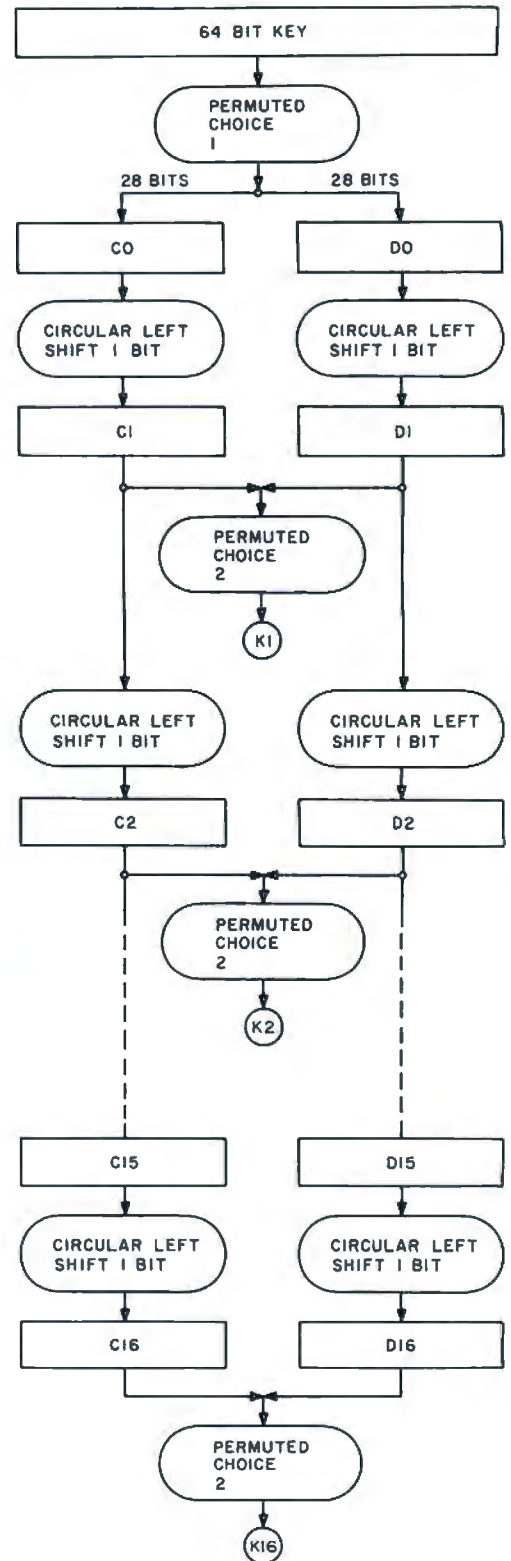

Figure 5: A process flow diagram showing how subkeys K_1 thru K_{16} are produced from a single key.

Table 3: A summary of the number of left circular shifts applied to Ci and Di at each iteration of subkey generation.

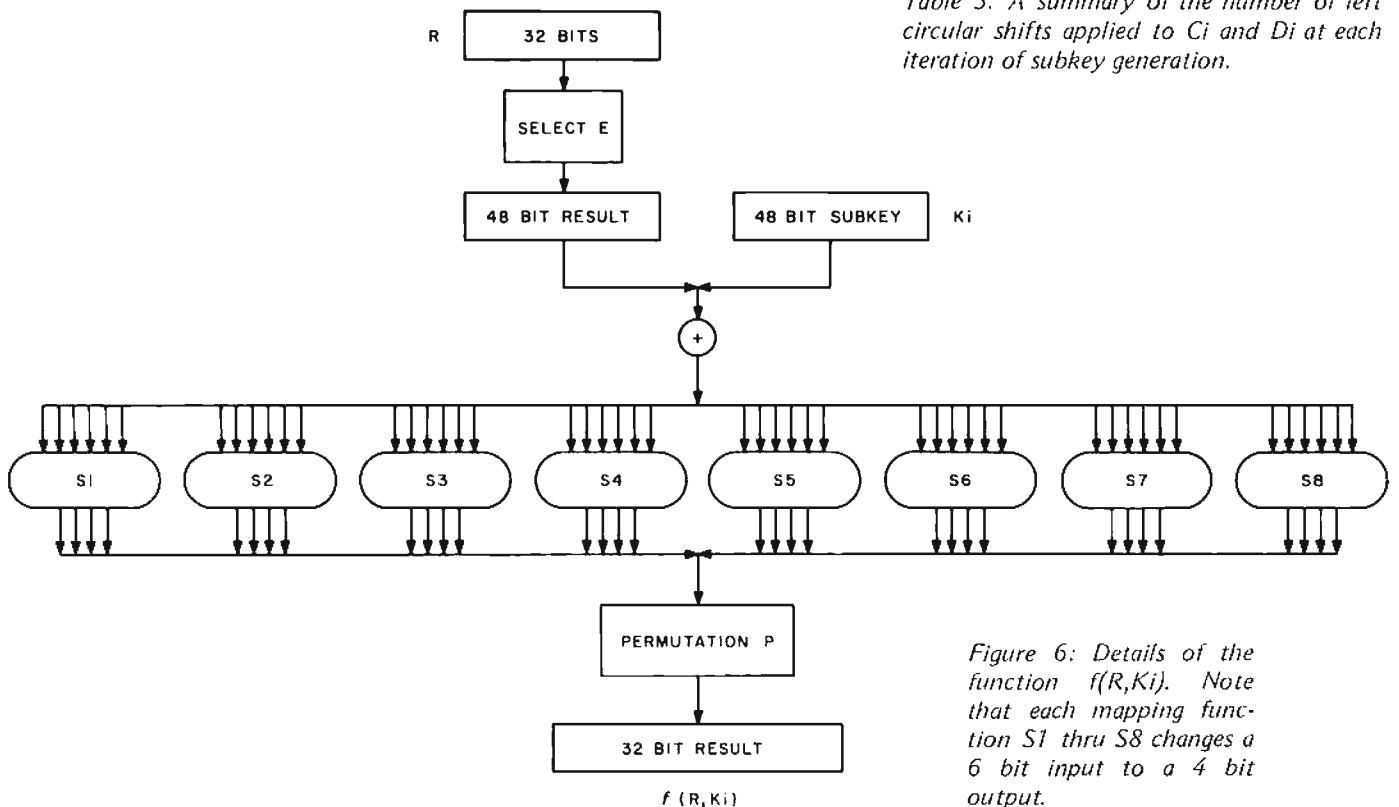

Figure 6: Details of the function $f(R, K_i)$. Note that each mapping function S1 thru S8 changes a 6 bit input to a 4 bit output.

C1 and D1 using permuted choice 2 to form a 48 bit subkey. Permuted choice 1 and permuted choice 2 are shown in tables 2a and 2b. Each successive subkey is generated in the same way: by shifting Ci and Di left (by one or two bits) and then using permuted choice 2. Table 3 shows the number of left shifts to be applied to Ci and Di for each iteration in the subkey generation.

Once K1, K2, . . . , K16 have been generated, it is not necessary to generate them again until the key is changed. The same set of subkeys is used for each encryption and decryption operation shown in figures 4a and 4b.

The final operation to understand is f (R,K), depicted in figure 6. The first operation is called select E. This is really a

permutation operation similar to the initial permutation operation previously discussed, except that the result has more bits than the input. Table 4 shows the select E permutation table. The 48 bit result of this operation is then added modulo 2 to the subkey. This result is reduced to a 32 bit result using a set of mapping functions known as S1, S2, . . . ,S8. These are used as shown in figure 6. Each group of six bits, going left to right, is mapped into a 4 bit word using a distinct mapping function. The mapping functions are shown in figure 5, and an example of how they are used is shown in figure 6. The six bits input to each S mapping function are used to generate a row address and column address as shown. The selected matrix entry is converted from its

Table 4: The Select E permutation table. The output contains more bits than the input in order to match length of subkey.

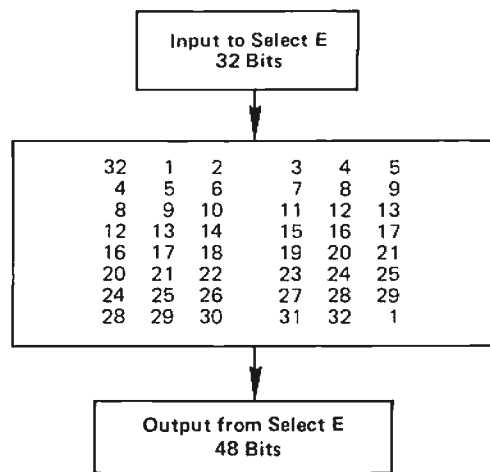

Table 6: Illustration of the use of S1 mapping function. The middle four bits of input give the column index. The first and last bits are the row index. The binary value of the selected table entry is output.

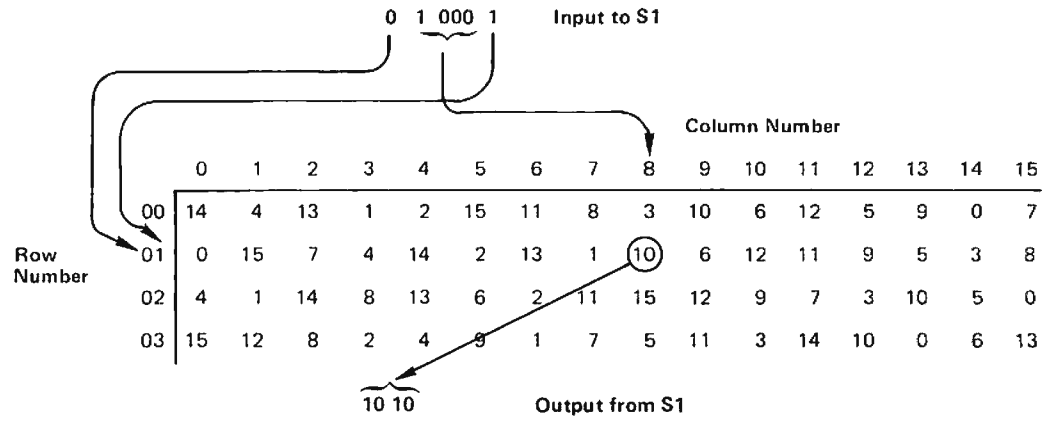

Table 7: Table for permutation P.

decimal representation to binary. A final 32 bit permutation, P, is then performed as shown in figure 6 to give the output f(R,K). Table 7 shows this permutation table.

This completes the details of the Standard Data Encryption Algorithm and should allow you to develop your own implementation. My particular implementation for the 6502 on the basic KIM-1 is given in part 2. It should provide you with some interesting insights into program optimization. ■

Post Office Box Q, Dept. C Philadelphia, PA 19105

Color. VP-590 add-on Color Board allows program control of 8 brilliant colors for graphics, color games. Plus 4 selectable background colors. Includes sockets for 2 auxiliary keypads (VP-580). \$69.*

Sound. VP-595 Simple Sound Board provides 256 tone frequencies. Great for supplementing graphics with sound effects or music. Set tone and duration with easy instructions. \$24.*

Music. VP-550 Super Sound Board turns your VIP into a music synthesizer. 2 sound channels. Program control of frequency, time and amplitude envelope (voice) independently in each channel. Program directly from sheet music! Sync provision for controlling multiple VIPs, multitrack recording or other synthesizers. \$49.*

Memory. VP-570 RAM Expansion Board adds 4K bytes of memory. Jumper locates RAM in any 4K block of up to 32K of memory. On-board memory protect switch. \$95.*

EPROM Programmer. VP-565 EPROM Programmer Board comes complete with software to program, copy and verify 5-volt 2716 EPROMs—comparable to units costing much more than the VP-565 and VIP put together! Programming voltages generated on board. ZIF PROM socket included. \$99.*

EPROM Interface. VP-560 EPROM Interface Board locates two 5-volt 2716 EPROMs (4K bytes total) anywhere in 32K of memory. VIP RAM can be re-allocated. \$34.*

ASCII Keyboard.** Fully encoded, 128-character ASCII encoded alpha-numeric keyboard. 58 light touch keys including 2 user defined keys! Selectable upper and lower case. Handsomely styled. Under \$50.*

Tiny BASIC.** VP-700 Expanded Tiny BASIC Board puts this high-level language on your VIP. BASIC stored in 4K of ROM. Ready for immediate use—no loading necessary. This expanded BASIC includes the standard Tiny BASIC commands plus 12 additional—including color and sound control! Requires external ASCII encoded alpha-numeric keyboard. \$39.*

Auxiliary Keypads. Program your VIP for 2-player interaction games! 16-key keypad VP-580 with cable (\$15*) connects to sockets provided on VP-590 Color Board or VP 585 Keyboard Interface Card (\$10*).

COSMAC VIP lets you add computer power a board at a time.

With these new easy-to-buy options, the versatile RCA COSMAC VIP (CDP18S711) means even more excitement. More challenges in graphics, games and control functions. For everyone, from youngster to serious hobbyist. And the basic VIP computer system starts at just \$249* assembled and ready to operate.

Simple but powerful—not just a toy.

Built around an RCA COSMAC micro-processor, the VIP includes 2K of RAM. ROM monitor. Audio tone with a built-in speaker. Plus 8-bit input and 8-bit output port to interface relays, sensors or other peripherals. It's

easy to program and operate. Powerful CHIP-8 interpretive language gets you into programming the first evening. Complete documentation provided.

Take the first step now.

Check your local computer store or electronics parts house. Or contact

RCA VIP Marketing, New Holland Avenue, Lancaster, PA 17604. Phone (717) 291-5848.

*Suggested retail price. CDP18S711 does not include video monitor or cassette recorder.
**Available 1st Quarter, 1979.

The fun way
into computers.

RCA

Continued from page 53

March 19-21, **Modern Integrated Circuits**, George Washington University, Washington DC. This course is structured to meet the needs of engineers, scientists, and technical managers who desire a better understanding of the latest technological advances in the area of integrated circuits. As such it examines all aspects of integrated circuit technology, starting from fundamental principles of construction and operation, to the most recent devices, their characteristics and specifications. A significant part of the course deals with the application of integrated circuits in linear and digital systems. Specific topics to be covered include detailed design examples of circuits using operational amplifiers and active filters, as well as computer arithmetic units, registers, and memories. Contact George Washington University, Continuing Engineering Education Program, Washington DC 20052.

March 19-21, **Project Management for Computer Systems**, Atlanta GA. This seminar is designed for the computer oriented professional responsible for the development and implementation of complex EDP systems. The seminar will illustrate techniques for planning, implementing, installing, and controlling projects. Contact The University of Chicago, Center for Continuing Education, 1307 E 60th St, Chicago IL 60637.

March 21-23, **Microcomputer Hardware and System Design Seminar**, Holiday Inn, Palo Alto CA. Polytechnic Institute for New York and the Institute for Advanced Professional Studies are presenting this 3 day seminar for engineers, programmers and technical managers with a working knowledge of digital hardware design and familiarity with the underlying concepts governing microprocessor operation, architecture, and systems design. This seminar will cover the operation, architecture, instruction set, and design techniques for 8 bit microprocessors. Contact Prof Donald D French, Institute for Advanced Professional Studies, 1 Gateway Ctr, Newton MA 02158, (617) 964-1412.

March 25-28, **Expo '79** Los Angeles Marriott, Los Angeles CA. Expo '79 is held in conjunction with the 16th Numerical Control Society Annual Meeting and Technical Conference. Contact Numerical Control Society, 1800 Pickwick Av, Glenview IL 60025, (312) 724-7700.

March 26-28, **Data Processing Operations Management**, Houston TX. This seminar will emphasize the management skill and techniques applicable to the data processing operations function. The curriculum is designed toward practical, applied management techniques to provide a sounder understanding of the ways of managing data processing operations more effectively. Contact The University of Chicago, Center for Continuing Education, 1307 E 60th St, Chicago IL 60637.

March 26-28, **Minicomputers and Distributed Processing**, New York NY. This seminar will examine the uses, economics, programming and implementation of minicomputers. Current hardware and software will also be evaluated. Contact The University of Chicago, Center for Continuing Education, 1307 E 60th St, Chicago IL 60637.

March 26-30, **Data Base Concepts and Design**, AMA Management Center, Chicago IL. Sponsored by the American Management Associations, this course will feature practical information to help the participant understand structure, concepts, design, software, and management. Contact American Management Associations, 135 W 50th St, New York NY 10020, (212) 586-8100.

March 27-29, **The Midwestern Computer Expo**, McCormick Pl, Chicago IL. Exposition by the leading vendors of data processing equipment and services. Contact Lee Mulder, The Caravan Group, 60 Austin St, Newton MA, (617) 964-4550.

April 3-5, **Specifications of Reliable Software**, Hyatt Regency Hotel, Cambridge MA. This conference is sponsored by the IEEE Computer Society. Contact Douglas T Ross, Softech Inc, 460 Totten Pond Rd, Waltham MA 02154, (617) 890-6900.

April 5-6, **Computers in Ophthalmology**, St Louis MO. This is a course in application of computers to ophthalmic patient care and clinical research. Sessions dealing with data bases, automated patient testing, artificial intelligence, and image processing are being planned. Contact Robert Greenfield, DSc, Biomedical Computer Laboratory, Washington University School of Medicine, 700 S Euclid Av, St Louis MO 63110.

April 5-6, **1979 Computer Users Conference**, East Texas State University, Commerce TX. The theme of this conference will be "Educating in a Computer Society." Contact Henrietta Gale, conference coordinator, Dept of Computer Science, East Texas State University, Commerce TX 75428.

April 9-11, **Data Processing Operations Management**, Miami FL. This seminar will emphasize the management skill and techniques applicable to the data processing operations function. The curriculum is designed toward practical, applied management techniques to provide a sounder understanding of the ways of managing data processing operations more effectively. Contact The University of Chicago, Center for Continuing Education, 1307 E 60th St, Chicago IL 60637.

April 9-12, **Interface '79**, McCormick Pl, Chicago IL. This is the seventh annual conference and exposition on data communications and computers. Contact The Interface Group, 160 Speen St, Framingham MA 01701.

Ithaca Audio

The Simple Up-Grade™

Trying to add computer memory is not much fun if you don't get everything you need.

step directions and diagrams. And if a personality jumper is required, it's *premade*.

The Simple
16K APPLE II[†]
UP-GRADE™ KIT

Everything you need to up-grade your Apple II in blocks of 16K.

- 8 tested and guaranteed 16K RAMs
- New Memory Select Units
- Use only a household screwdriver.
- Easy instructions

ITHACA AUDIO
P.O. Box 91 Ithaca, New York 14850

16K TRS-80
UP-GRADE KIT

Everything you need to up-grade your TRS-80 to a 16K system.

- 8 tested and guaranteed 16K RAMs
- New programming jumpers
- Easy-to-follow instructions
- Only tool required is a household screwdriver

ITHACA AUDIO
P.O. Box 91 Ithaca, New York 14850

The TRS-80* memory expansion was our first Simple Up-Grade. Now there are two more—for owners of Apple II[†] and Exidy Sorcerer[‡] computers. Each kit is 100% guaranteed—if a part ever falls, we replace it FREE. Your Ithaca Audio dealer has them in stock, only \$140. Now you can afford to add high quality, high density memory to your system for remarkably little—far less than you would expect to pay from Radio Shack, Apple, or Exidy directly.

These Simple Up-Grades are Ithaca Audio's first step in adding more capability and reliability to your computer at lower cost. Other Up-Grades are on the way to your dealer now.

Receiving unprogrammed jumpers and having to program them yourself is not much better. Most important, that's the place where the problems are introduced.

So Ithaca Audio's better idea is the Simple Up-Grade. Each Simple Up-Grade is specially designed to make adding memory foolproof. We include all the parts you'll need; 8 prime, tested 16K RAMs, along with concise step by

The Simple
16K SORCERER[‡]
UP-GRADE™ KIT

Everything you need to up-grade your Sorcerer in blocks of 16K.

- 8 tested and guaranteed 16K RAMs
- New programming jumpers
- Use only a screwdriver and soldering iron
- Easy instructions

Get a **PASCAL ENGINE**TM

*Not just a machine
that emulates one.*

The Pascal engine doesn't merely interpret P-Code, its instruction set *is* P-Code. This powerful computer runs the full UCSD Pascal Operating System and includes all of the following items:

- Pascal microengineTM with 32 bit **FLOATING POINT** instructions including floating point **MULTIPLY & DIVIDE** with provision for expanding instruction set to include double precision.
- **64K** bytes (32K words) of RAM expandable to **128K** bytes. (64K words)
- **FLOPPY DISC CONTROLLER** with direct memory access (DMA) switch selectable for:
 - single, or double density
 - 8" floppy or mini floppy
 - 1 to 4 drives (same type)
- Complete UCSD Pascal Operating System
 - PASCAL compiler — File Manager
 - BASIC compiler — Screen oriented editor
 - GRAPHIC package — Debugger
- Two RS-232 asynchronous ports (110-19,200 baud)
- Two 8-bit parallel ports
- Auto test microdiagnostics
- Documentation

\$2900 Complete with stylized low profile housing and power supply

COMPUTER SOFTWARE

For Homeowners, Businessmen, Engineers, Hobbyists, Doctors, Lawyers, Men and Women

We have been in business for over nine years building a reputation for providing a quality product at nominal prices — NOT what the traffic will bear. Our software is:

- **Versatile** — as most programs allow for multiple modes of operation.
- **Tutorial** — as each program is self prompting and leads you through the program (most have very detailed instructions contained right in their source code).
- **Comprehensive** — as an example our PSD program not only computes Power Spectral Densities but also includes FFT's, Inverse-transforms, Windowing, Sliding Windows, simultaneous FFT's variable data sizes, etc. and as a last word our software is:
- **Readable** — as all of our programs are reproduced full size for ease in reading.

- **Virtually Machine Independent** — these programs are written in a subset of Dartmouth Basic but are not oriented for any one particular system. Just in case your Basic might not use one of our functions we have included an appendix in Volume V which gives conversion algorithms for 19 different Basic's; that's right, just look it up and make the substitution for your particular version. If you would like to convert your favorite program into Fortran or APL or any other language, the appendix in Volume II will define the statements and their parameters as used in our programs.

Over 85% of our programs in the first five volumes will execute in most 8K Basic's with 16K of free user RAM. If you only have 4K Basic, because of its lack of string functions only about 60% of our programs in Volumes I through V would be useable, however they should execute in only 8K of user RAM.

For those that have specific needs, we can tailor any of our programs for you or we can write one to fit your specific needs.

Preview of the Z-8000

All figures in this article are courtesy of Zilog.

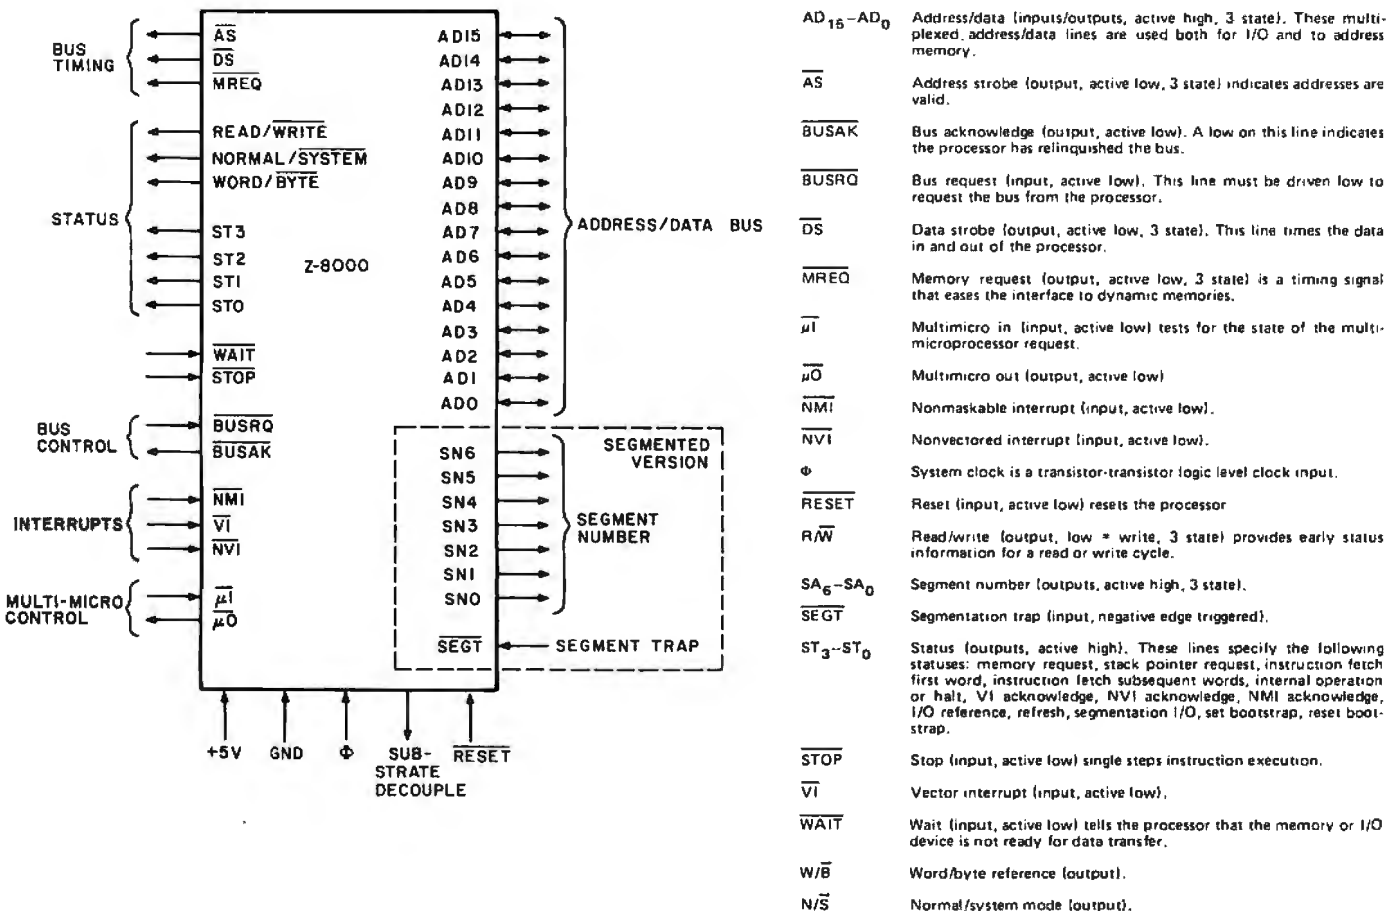

The Z-8000 (shown in figure 1) is Zilog's new entry in the field of 16 bit processors. It is a single chip processor with more raw processing power than many popular minicomputers. Benchmarked against the popular PDP-11 family, the Z-8000 is between the 11/45 and the 11/70 in speed for many simple instructions. The processor also introduces several sophisticated minicomputer hardware techniques such as memory management, separate system/user operation modes, separate memory space for data, stack contents and code, and long word instructions. The remainder of this review

will offer a very brief description of the Z-8000 so that future thinking personal computer experimenters can begin planning applications for it.

Architecture

The Z-8000 is a general register machine with 1 and 2 address instructions, faintly reminiscent of a PDP-11. It comes in two varieties: segmented or nonsegmented, in reference to the memory management capability which will be discussed later. I will discuss only the segmented processor

Figure 1: Pin diagram of Zilog's new Z-8000 16 bit processor. The device is both fast and versatile, with over 110 instructions in its instruction set. The Z-8000 is available in two versions: segmented and unsegmented. The segmented version uses an outboard auxiliary integrated circuit called a memory management device to provide memory segment mapping or relocation and memory protection (the memory in the Z-8000 is divided into 64 K byte blocks called sections).

since the nonsegmented processor is a functional subset of the former. Nonsegmented mode is a software selectable option in the segmented processor.

The processor has sixteen 16 bit registers which are logically subdivided (figure 2) into sixteen 8 bit registers, eight 32 bit registers and four 64 bit registers. All of the 8 and 16 bit registers are available as general purpose accumulators. Fifteen of the 16 bit registers are available as index registers. Registers 14, or 14 and 15 serve as stack pointer depending on the segmentation mode in effect. There are two sets of these registers to provide for separate system and user stacks. There is a 64 bit status register which contains the program counter and various flags. There is also a rate programmable refresh counter for servicing dynamic memories.

There are seven discrete data types recognized by the Z-8000. In ascending order of size they are bits, BCD (binary coded decimal) digits (4 bits), bytes (8 bits), words (16 bits), long words (32 bits), byte strings (8n + 8 bits), and word strings (16n + 16 bits). The string types consist of sequential bytes or words preceded by a word count. Strings may be accessed in either ascending or descending address order. Bytes are the smallest directly addressable data type. Bits and binary coded decimal are dealt with using special instructions such as SET B (set bit), and DAB (decimal adjust).

One of the most unusual features of this processor is the large memory space. The segmented Z-8000 has 24 address lines yielding 16,777,216 directly addressable bytes. The system and the user may both have their own memory, as may program code, data, and data stack, for a grand total of 96 M bytes of on line memory. The memory is arranged in 64 K byte blocks called segments. An outboard support integrated circuit, called the memory management unit (MMU), is available to provide, transparently to the user, segment mapping or relocation and memory protection. To access this mountain of memory, there are eight addressing modes, illustrated in figure 3.

The Z-8000 has over 110 different instructions, many of which have several possible addressing modes. The instruction set is summarized in table 1. There are many

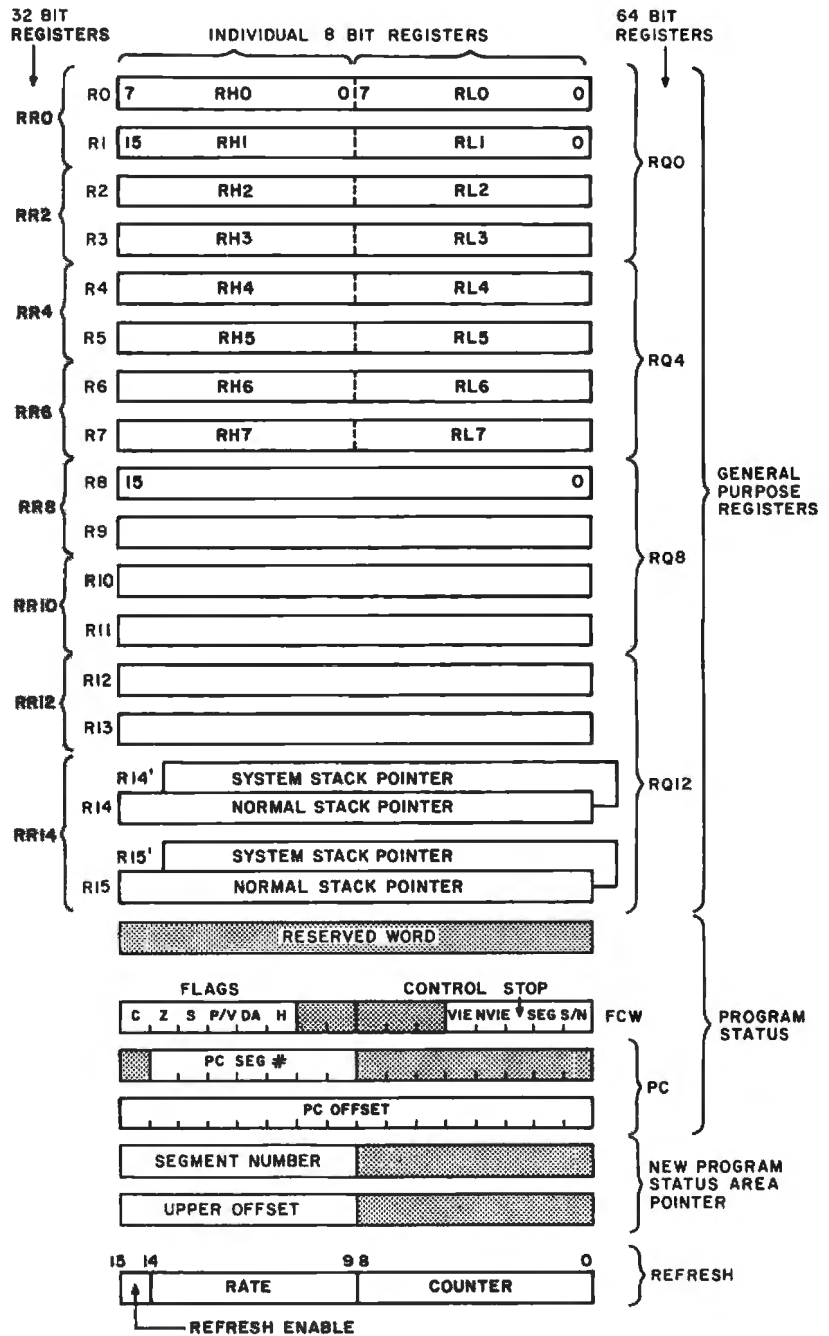

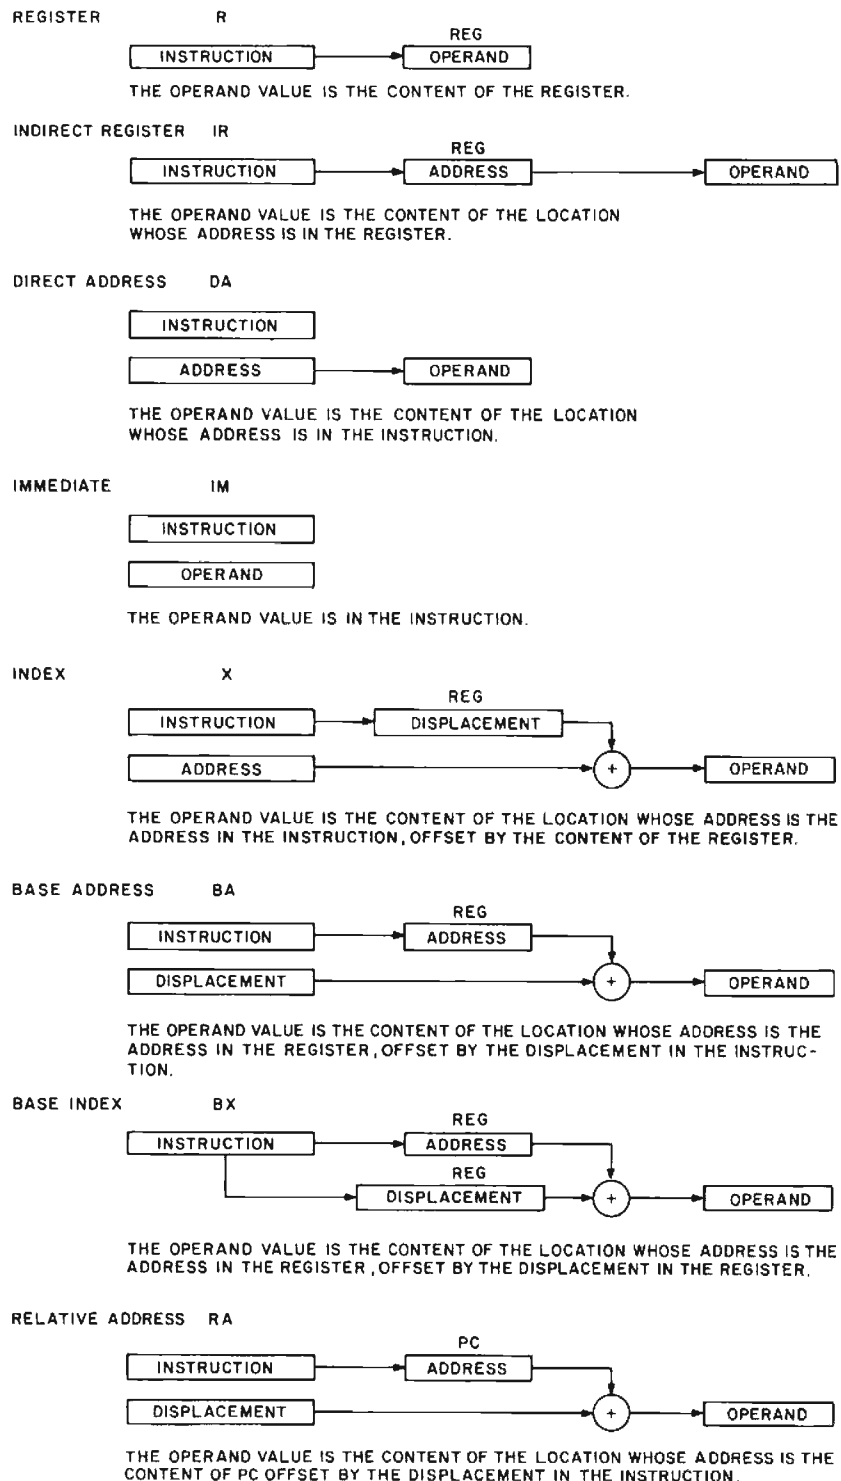

Figure 2: Z-8000 registers. The Z-8000 has sixteen 16 bit registers logically subdivided into sixteen 8 bit registers, eight 32 bit registers, and four 64 bit registers. The 8 and 16 bit registers are available as general purpose accumulators, and 15 of the 16 bit registers are available as index registers.

powerful instructions which are not usually seen in microcomputers. Not many microcomputers or small minicomputers have extended precision multiply and divide, or translate, increment, and repeat. There are string comparison operations and block move operations. The decrement and jump-on-nonzero instruction of the Z-80 has been extended to allow any word or byte length

register as an index counter. There is also a system call instruction which performs a software interrupt to the operating system. This is a very convenient means of communication between the user and system. There are other so-called traps that imitate an interrupt to the operating system. They are used to preserve software integrity, and occur when there is an illegal memory or instruction reference, or when a user mode program attempts to execute a privileged or I/O (input/output) instruction. A parti-

Figure 3: Z-8000 addressing modes.

What this country needs is a good \$8000 small business computer.

We agree! Now for less than \$8000, you can purchase an Ohio Scientific small business computer system complete with software packages for Accounting, Information Management and Word Processing. Here are the system's capabilities in detail:

Accounting: Supports accounts receivable, payables, cash receipts and disbursements, general ledger, balance sheet, P & L statement, payroll, inventory and order entry for small businesses.

Information Management: Stores any collection of information in disk files via a Data Base Manager. Can instantly retrieve information, generate lists, reports and mailing labels from this data as well as perform statistical analysis. All without any additional software. An optional "Query" system can answer conventional "English" questions pertinent to information in the system asked by untrained office users.

Word Processing: Can handle letters, reports and manuscripts. Uses totally electronic editing with disk file storage. Has character and line Edit, Find, Change, Delete, Transfer, Duplicate and Append capabilities. On output, it has text justification, proportional spacing, hyphenation and many more features.

Yes, an under \$8000 Ohio Scientific small business system includes all this software as well as 48K bytes of 180 nanosecond main memory, dual 8" floppy disk drives for 600K bytes of disk storage, a 1920 character upper/lower case CRT terminal, a 132 column tractor feed line printer, and the programming language BASIC for user generated programs if desired. And the system doesn't stop here, it has the performance and modular construction for growth with your use. The system can be expanded to nearly one million bytes of main memory, 80 megabytes of disk storage and 16 users (time share configuration), or it can be connected to a network of other small computers (distributed processing configuration). Numerous optional systems and applications software packages are available including the programming languages FORTRAN and COBOL and applications software for specific businesses.

Ohio Scientific small business systems are sold, leased and serviced nationwide by a network of business system dealers. Call or write to arrange a demonstration with your local dealer.

OHIO SCIENTIFIC

cularly interesting subset of instructions concerns the use of a pair of pins on the Z-8000 packaged called $\mu 1$ and $\mu 0$. These pins, and the instructions which govern them, allow for the combination of Z-8000 into efficient multi-processor or network systems. The only regrettable lack I've noticed thus far is the absence of memory-to-memory instructions.

Performance, in terms of execution speed, is a major factor in the selection of a processor. In table 2, I have tabulated the

approximate speed of several common processors for simple tasks. Obviously, the Z-8000 is way out in front, competing very favorably with a popular medium sized mini-computer whose processor's cost is more than two orders of magnitude greater. The Z-8000's speed and memory make it the best thing yet for personal applications which involve number crunching. I can easily imagine it as the heart of a personal FORTRAN or

Text continued on page 91

Memory Management

Memory management, as the name implies, is a clever technique to handle large amounts of memory in a flexible fashion. In most computer systems, this management requires the large memory to be broken up into smaller (eg: 64 K byte) chunks. Each program or task residing in memory is assigned into its own unique chunk or segment. In general, segments may vary in length, but a program residing in a particular segment may not exceed that segment in length. Often a program will not need to directly address a vast amount of memory, and if a particular application program or set of programs will fit into segments, then management can be used. Management provides three main advantages in the Z-8000:

1. Since programs are constrained to fit in 64 K bytes or less, a 16 bit address is sufficient instead of the 24 bits required to address 16 M bytes. This obviously leads to a more compact and efficient code.
2. Programs residing in segments are mapped into what is known as logical or virtual address space. Virtual addresses are simply the addresses of locations in a segment from hexadecimal 0000 to FFFF. They are called virtual because they are relative only to the start of their segment and need not bear any relation to the actual physical addresses in the memory circuitry. Programs in segments are thus totally relocatable, needing only to inform the memory management device of the physical starting address of the particular segment. Figure 4 demonstrates this principle. Note that consecutive segments need not appear consecutively mapped into physical memory and also that segments may overlap physical memory.
3. Segmenting easily provides for memory protection. Since the memory management device knows the length of each segment, any attempt by a user task to access physical memory outside of its segment causes a segment violation and a software interrupt to the operating system. This is very useful when running a time-sharing system or debugging a new program.

The memory management device works simply by adding a constant base address for each segment to any memory references issued by that segment. The device in the Z-8000 also checks a number of conditions such as system versus user state, code versus data, read write versus read only, and valid base address in addition to the segment size. If any mismatches or faults occur, the operating system is informed.

64K bytes of fast, low power dynamic RAM.

\$695⁰⁰

32K bytes of faster static RAM.

\$595⁰⁰

Both Our UNCommon Dynamic and our UNCommon Static RAMS have the following features and specifications:

- Compatible with: IMSAI, VECTOR, SOL, TDL, MITS, IA, CROMEMCO, NORTH STAR, and most other S-100 systems.
- Inputs buffered with 1 LS TTL load.
- Outputs are all three state.
- Memory selectable and deselectable in 4K increments.
- DIP switch selectable addressing.
- Phantom selectable on pin 67.
- Disc compatible. DMA compatible to 1MHz.
- Reliability — all boards are fully tested
 - a. Bus address and control line timing skew.
 - b. Word pattern sensitivity.
 - c. All boards are burned-in.
- Full documentation.
- Industrial quality design and components. Glass epoxy boards. Silk screened legends. Gold plated edge connectors. All IC's on sockets.
- Delivery — Stock to 30 days.
- Guaranteed performance for one year on parts and labor. Full refund if returned undamaged within 14 days.

Our UNCommon Dynamic RAM Features:

- 64K bytes of dynamic RAM with on board transparent refresh.
- S-100 interface compatible with crystal controlled timing INDEPENDENT of bus or processor timing.
- No wait states or cycle stealing with 8080 or Z80 to 4MHz. Up to 5MHz with 1 wait state.

Our UNCommon Static RAM Features:

- 32K bytes of static RAM using 300n Sec low power static RAMS.
- No wait states or cycle stealing with 8080, 8085, or Z80 processors up to 5MHz.
- Organized in 8 independently addressable 4K byte increments at 4K boundaries.

I would like to order the following fully assembled and tested UNCommon memory

UNCommon Dynamic RAMS		
<input type="checkbox"/>	DM0400	64K RAM \$695 ⁰⁰

Table 1: Summary of the Z-8000 instruction set, slightly condensed.

The instruction set table is somewhat abridged due to space considerations. For example, almost all data manipulation type instructions (ie: data transfers, or arithmetic) have associated forms for the handling of byte length and long word length operands. The mnemonic for an alternate length operand is created by appending a B (for byte) or an L (for long word) to the standard op code mnemonic. For example, a byte length COMPARE (CP) would be CP B = CPB. The symbols and abbreviations used in this table are defined as follows:

Operands	Addressing Modes	Miscellaneous
b - bit number	BA - base address	← - is replaced by
CC - condition code	BX - base index	@ - indirect
CTLR - a control register	DA - direct address	R _n , R _n +1 - register pair
dst - destination	IM - immediate	
FLGR - flag register	IR - indirect register	
int - any interrupt enable bit	R - register	
n - a small integer	RA - relative address	
src - source	X - index	

Loads and Exchanges

Op code	Operands	Operation	Addressing Modes	SBC	R,src	Subtract with carry	R
CLR	dst	Clear dst ← 0.	R,IR,DA,X	SUB	R,src	R ← R - src - carry. Subtract R ← R - src.	R,IR,DA,X,IM
EX	R,src	Exchange temp ← src src ← R R ← temp.	R,IR,DA,X

SYM-1, 6502-BASED MICROCOMPUTER

- FULLY-ASSEMBLED AND COMPLETELY INTEGRATED SYSTEM that's ready-to-use
- ALL LSI IC'S ARE IN SOCKETS
- 28 DOUBLE-FUNCTION KEYPAD INCLUDING UP TO 24 "SPECIAL" FUNCTIONS
- EASY-TO-VIEW 6-DIGIT HEX LED DISPLAY
- KIM-1* HARDWARE COMPATIBILITY
- The powerful 6502 8-Bit MICROPROCESSOR whose advanced architectural features have made it one of the largest selling "micros" on the market today.
- THREE ON-BOARD PROGRAMMABLE INTERVAL TIMERS available to the user, expandable to five on-board.
- 4K BYTE ROM RESIDENT MONITOR and Operating Programs.
- Single 5 Volt power supply is all that is required.
- 1K BYTES OF 2114 STATIC RAM onboard with sockets provided for immediate expansion to 4K bytes onboard, with total memory expansion to 65, 536 bytes.
- USER PROM/ROM: The system is equipped with 3 PROM/ROM expansion sockets for 2316/2332 ROMs or 2716 EPROMs
- ENHANCED SOFTWARE with simplified user interface
- STANDARD INTERFACES INCLUDE:
 - Audio Cassette Recorder Interface with Remote Control (Two modes: 135 Baud KIM-1* compatible, Hi-Speed 1500 Baud)
 - Full duplex 20mA Teletype Interface
 - System Expansion Bus Interface
 - TV Controller Board Interface
 - CRT Compatible Interface (RS-232)
- APPLICATION PORT: 15 Bi-directional TTL Lines for user applications with expansion capability for added lines
- EXPANSION PORT FOR ADD-ON MODULES (51 I/O Lines included in the basic system)
- SEPARATE POWER SUPPLY connector for easy disconnect of the d-c power
- AUDIBLE RESPONSE KEYPAD

Synertek has enhanced KIM-1* software as well as the hardware. The software has simplified the user interface. The basic SYM-1 system is programmed in machine language. Monitor status is easily accessible, and the monitor gives the keypad user the same full functional capability of the TTY user. The SYM-1 has everything the KIM-1* has to offer, plus so much more that we cannot begin to tell you here. So, if you want to know more, the SYM-1 User Manual is available, separately.

SYM-1 Complete w/manuals \$269.00
SYM-1 User Manual Only 7.00
SYM-1 Expansion Kit 75.00

Expansion includes 3K of 2114 RAM chips and 1-6522 I/O chip.

SYM-1 Manuals: The well organized documentation package is complete and easy-to-understand.

SYM-1 CAN GROW AS YOU GROW. Its the system to BUILD-ON. Expansion features that are soon to be offered:

8K Basic ROM \$159.00
TV Interface Board 349.00

QUALITY EXPANSION BOARDS DESIGNED SPECIFICALLY FOR KIM-1, SYM-1 & AIM 65

These boards are set up for use with a regulated power supply such as the one below, but, provisions have been made so that you can add onboard regulators for use with an unregulated power supply. But, because of unreliability, we do not recommend the use of onboard regulators. All I.C.'s are socketed for ease of maintenance. All boards carry full 90-day warranty.

All products that we manufacture are designed to meet or exceed industrial standards. All components are first quality and meet full manufacturer's specifications. All this and an extended burn-in is done to reduce the normal percentage of field failures by up to 75%. To you, this means the chance of inconvenience and lost time due to a failure is very rare; but, if it should happen, we guarantee a turn-around time of less than forty-eight hours for repair.

Our money back guarantee: If, for any reason you wish to return any board that you have purchased directly from us within ten (10) days after receipt, complete, in original condition, and in original shipping carton; we will give you a complete credit or refund less a \$10.00 restocking charge per board.

VAK-1 8-SLOT MOTHERBOARD

This motherboard uses the KIM-4* bus structure. It provides eight (8) expansion board sockets with rigid card cage. Separate jacks for audio cassette, TTY and power supply are provided. Fully buffered bus.

VAK-1 Motherboard \$129.00

VAK-2/4 16K STATIC RAM BOARD

This board using 2114 RAMs is configured in two (2) separately addressable 8K blocks with individual write-protect switches.

VAK-2 16K RAM Board with only \$239.00

8K of RAM (1/2 populated)

VAK-3 Complete set of chips to \$175.00

expand above board to 16K

VAK-4 Fully populated 16K RAM \$379.00

VAK-5 2708 EPROM PROGRAMMER

This board requires a +5 VDC and ± 12 VDC, but has a DC to DC

multiplier so there is no need for an additional power supply. All software is resident in on-board ROM, and has a zero-insertion socket.

VAK-5 2708 EPROM Programmer \$269.00

VAK-6 EPROM BOARD

This board will hold 8K of 2708 or 2758, or 16K of 2716 or 2516 EPROMs. EPROMs not included.

VAK-6 EPROM Board \$129.00

VAK-7 COMPLETE FLOPPY-DISK SYSTEM (May '79)

VAK-8 PROTOTYPING BOARD

This board allows you to create your own interfaces to plug into the motherboard. Etched circuitry is provided for regulators, address and data bus drivers; with a large area for either wire-wrapped or soldered IC circuitry.

VAK-8 Prototyping Board \$49.00

POWER SUPPLIES

ALL POWER SUPPLIES are totally enclosed with grounded enclosures for safety, AC power cord, and carry a full 2-year warranty.

FULL SYSTEM POWER SUPPLY

This power supply will handle a microcomputer and up to 65K of our VAK-4 RAM. ADDITIONAL FEATURES ARE: Over voltage Protection on 5 volts, fused, AC on/off switch. Equivalent to units selling for \$225.00 or more.

Provides +5 VDC @ 10 Amps & ± 12 VDC @ 1 Amp

VAK-EPS Power Supply \$125.00

KIM-1* Custom P.S. provides 5 VDC @ 1.2 Amps
and +12 VDC @ .1 Amps

KCP-1 Power Supply \$41.50

SYM-1 Custom P.S. provides 5 VDC @ 1.4 Amps

VCP-1 Power Supply \$41.50

Z-8000 Peripheral Support Circuits

Name	Function
Z-MBU	Microprocessor buffer unit for high speed elastic buffering between processors, and processors and peripherals. Organized in a 256 by 8 bit FIFO (first in first out) configuration. Can be used to interface Z-Bus systems to most other microprocessors.
Z-FIFO	First in first out buffer memory provides expansion of the Z-MBU to 16 bit words and any depth.
Z-CIO	Counter/timer and parallel I/O circuit contains three counter/timers and three parallel ports. Two of the parallel ports are eight bits wide and provide four handshaking modes, including IEEE-488 instrument bus protocol. The third port is four bits wide. The counters are all 16 bits wide.
Z-SIO	Serial I/O circuit contains two independent full duplex synchronous/asynchronous receiver/transmitters (USARTs). Each data channel contains full modem controls, programmable clock generator, and parity or CRC error code generation and checking.
Z-UPC	Universal peripheral controller is a Z-Bus compatible version of Zilog's new Z-8 8 bit microcomputer on a chip. It includes 124 general purpose registers, 2 K of masked read only memory, an internal UART, and two counter/timers.
Z-Bus RAM	There are two versions of these programmable memory circuits which directly interface to the Z-Bus. Both are organized as byte-wide structures to reduce the complexity of small, local memory design. <ol style="list-style-type: none"> 4 K by 8 pseudostatic programmable memory has internal and transparent refresh circuitry. Its access time is in the range of 200-300 ns. 2 K by 8 fully static programmable memory has access times below 150 ns.

Table 2: Comparison of the Z-8000 to several popular processors in the performance of several simple tasks.

Task	Z-8000 ¹	8080A-1 ²	Z-80A ³	LSI-11 ⁴	PDP 11/45 ⁵
Load Byte (Register to Register) (A register in Z-80, 8080)	0.75	1.6	1.0	2.95	0.90
Load Word (Memory to Register) (to HL in Z-80, 8080)	2.25	5.12	4.0	5.6	2.86
Add (16 bit)	2.25	9.61 ⁶	5.25 ⁷	6.3	2.86
Multiply (16 bit)	17.50	—	—	27 – 64	5.64

APL machine which could run large application packages such as SPICE for circuit analysis or SPSS for statistics, and solve dynamics equations on line for real time graphics simulations like lunar lander, or very large chess playing programs.

According to sources at Zilog, the Z-8000 and its memory management device support chip will soon be available in large quantity. The Z-8000 is compatible with the already available Z-80 family of support chips such as the SIO (serial I/O), the CTC (timers), and the PIO (parallel I/O), etc. A new series of extended support chips for the Z-8000 is also in the works. So far five LSI peripheral devices and a new memory family have been announced. The text box on opposite page contains a brief description of these new devices. The usual line of microprocessor support products including single board computers, evaluation boards and development systems will also be available. Although details are not available as I write this, the system bus structure will probably be oriented toward high performance multiprocessor systems. As for software, Zilog has announced a disk based development system and the PLZ, BASIC, COBOL, FORTRAN languages. Also there is a Z-80-to-Z-8000 translator. I expect a real time, multitasking and multiprocessing operating system to be available soon in order to take advantage of this processor's many resources. ■

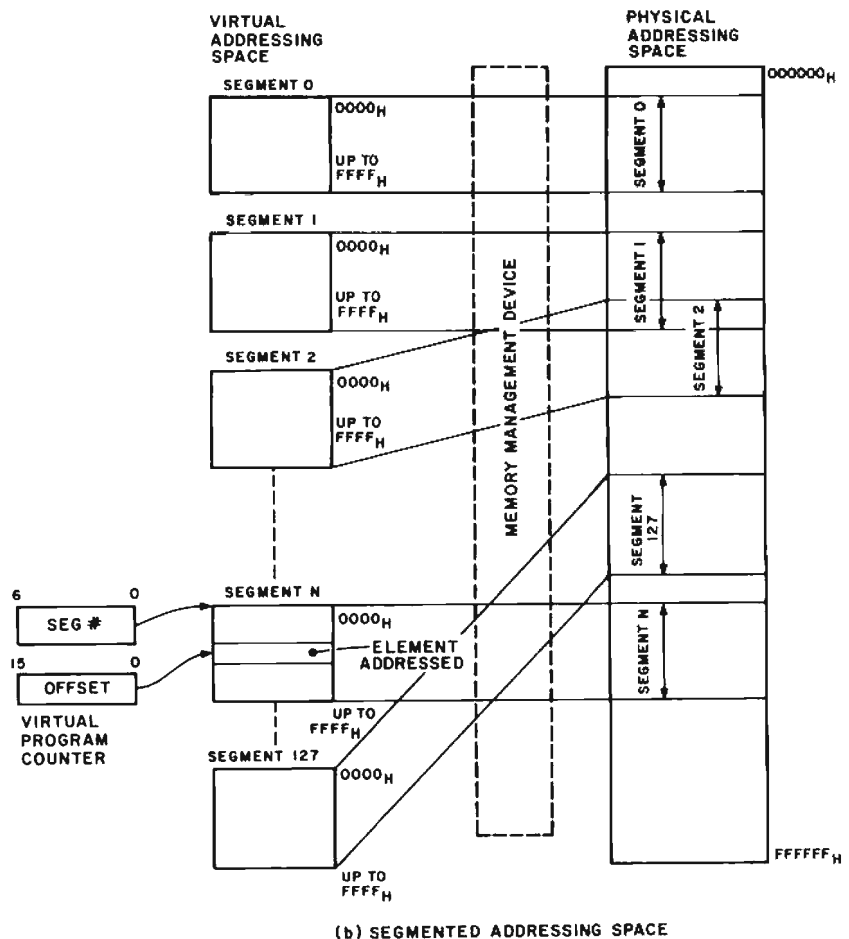

Figure 4: Logical to physical address translation using the memory management device. The Z-8000 allows the programmer to make use of virtual memory addresses, which are simply the addresses of locations in a memory segment from hexadecimal 0000 to FFFF. Virtual addresses are relative only to the start of their segment and need not bear any relation to physical addresses in memory. The clever use of virtual memory techniques can yield high-powered programming results.

Inverse Trig Functions

Alan R Miller
New Mexico Tech
Socorro NM 87801

All except the very smallest BASIC interpreters provide sine, cosine, tangent and inverse tangent functions. None, that I am aware of, have the inverse sine or inverse cosine functions. These two functions are very simple to generate using the inverse tangent function. Lines 10 and 20 of listing 1 contain the definition of the inverse sine and inverse cosine, respectively. Lines 30 to 80 contain a driver function for demonstration purposes. ■

Listing 1:

```

10 DEF FNSN (X) = ATN (1/SQR(1/(X*X)-1))
20 DEF FNCS (X) = ATN (SQR(1/(X*X)-1))
30 PRINT "A  "; "ARC SIN"; " SIN"; "ARC COS"; "COS"
40 INPUT "ARC"; A
50 B=FNSN(A)
60 C=FNCS(A)
70 PRINT A; B, SIN(B),C,COS(C)
80 GOTO 40
    
```

Odd Tones

The following program is entered and run:

(For the 6800 processor)	(For the 8080 processor)
L3: MVI A, #X	L3: LDAA #X
L2: MVI B, #A8 (hex)	L2: LDAB #A8 (hex)
L1: DCR B	L1: DECB
JNZ L1	BNE L1
DCR A	DECA
OUT 00	STAA @FF00 (assume port 0 is this location as a simple output latch)
JNZ L2	BNE L2
JMP L3	BRA L3

By connecting a small speaker (in series with a 220 ohm resistor) between the least significant bit of port 0 and ground, we hear a tone. However, for X equal to an odd number, an audible blip is heard periodically, while for X equal to an even number, no blip is heard at any time. Why is a blip heard for odd Xs only? Try these programs or simply analyze the waveforms, then turn to page 178 for an answer. ■

Pay a little bit more and get a printer that's brighter than your computer. The BrighterWriter.™

When a few dollars more buys you a first-class impact printer, why settle for a toy? The BrighterWriter gives you quality to start with. And versatility that stays even if you outgrow your present personal computer.

Built smart like the big ones.

The BrighterWriter's a smart printer. There's a microcomputer inside. It outwits even the bigger, higher-priced printers. So you get versatility to do all kinds of printing. And power to grow on.

Prints fat, skinny, tall, small.*
This printer can be as creative as your imagination. Stretch out your characters. Squeeze them close. Make them high. Low. Bold. Banner. You name it.

Plugs into your computer.

Most popular personal computers interface to the BrighterWriter. Simply and quickly. Hundreds of BrighterWriters are working in Apple, TRS-80, Heathkit, S-100 and many other personal computer systems right now.

Pictures and fancy symbols.*

The BrighterWriter draws out your creativity. You can print drawings, graphs, diagrams, bold symbols, or just about any graphic you can imagine.

Picture your page as thousands of dots. The BrighterWriter can fill in the dots, plot them contiguously, stack them, or scatter them. And its special set of graphic characters

AaBb
CcDd
EeFf

simplifies the process.

Prints any character a typewriter can. Faster . . .

The BrighterWriter can print plain and simple. With 7x7 dot matrix clarity. You get all the letters, numbers, and standard symbols of a regular

typewriter. At up to 80 cps throughput.

Ordinary paper.

Fancy or plain, the BrighterWriter prints on ordinary paper. Better yet, it prints on many shapes of paper. Single sheets. Roll. Fanfold.

Want more copies? The BrighterWriter prints multiple copies without extra adjustments.

Four easy buttons.

Operating the BrighterWriter couldn't be simpler. Up-front controls are easy to get to. A power

button to turn it on. A test button to self-test your printer. A paper feed button to advance the sheets or forms. A line feed button to advance the paper a line at a time.

Prints any-which-way.

The BrighterWriter comes in two models. The IP-225, at \$949, gives you a BrighterWriter with tractor-feed drive for precision forms control. This one can handle everything from labels to 8½" paper widths.

It has eight form lengths and gives you all the features of our IP-125.

A brighter buy.

Our IP-125, friction-feed, BrighterWriter has a 96 character set and prints on 8½" wide paper.

Upper and lowercase. It prints expanded characters, too. You can choose a RS-232 serial or parallel interface. \$799

Lots of goodies.

There's more. Choose all kinds of options for your BrighterWriter. Up to 132 characters per line, variable character densities, larger buffers, special graphics packages, interface cables, and more.

Give us a call or write. Integral Data Systems, 14 Tech Circle, Natick, MA 01760, (617) 237-7610.

Better yet, see the BrighterWriter at the store nearest you.

Integral Data Systems, Inc.

Scotch Magic Transparent Tape

Table 1: Materials required for printed circuit board layout.

Figure 1: The author's design for a homebrew light table used for drawing printed circuit board layouts. A sheet of Plexiglas or other clear plastic illuminated by a lamp is used as the drawing surface.

Magazines for electronic hobbyists sometimes run articles about do-it-yourself printed circuit layout and construction. Unfortunately I never saw an article which presented a unified printed circuit design strategy for large and very large systems (eg: a board with 20 or more integrated circuits).

Consequently, when the time came for me to design the printed circuit boards for a system involving more than 900 semiconductors, with greater than 60 percent of that count being integrated circuits, I didn't know where to begin.

Determination is the prime motive force in a project that large, so I went ahead and started. Along the way I took notes about what I learned. Using the methods I developed, you should be able to design double sided printed circuits for your own behemoth kluge without undue anger or frustration.

To undertake a large printed circuit project, you should be properly equipped. Simple "pen and ink on grid paper" techniques may be adequate for small boards, but on a larger layout, even with only 20 integrated circuits, you will have an absolute minimum of almost 300 integrated circuit leads. Try drawing that many pads on 0.1 inch centers, not to mention interconnecting traces and associated components, and you will end up in a sobbing heap on your workshop floor.

Table 1 lists the materials necessary to the initial design of your printed circuit layout.

The black pencil will be used to delineate components and pads on your drawing. The red pencil is used to mark conductor runs for the solder side of the board, while the blue pencil marks runs on the component side. A necessary adjunct to the pencils is the eraser and pencil sharpener. Most likely, neither will see as much use as the pencils themselves, but both should be close at hand.

The tracing vellum should be good quality. You will not appreciate tears or holes as a result of the erasing you will be doing.

A grid is essential to good planning. Grids are precision printed on dimensionally stable Mylar and are available in a variety

of styles. Your selection will depend largely on the scale to which you draw your design. The most commonly used scales are 4x, 2x, and 1x. The 4x and 2x scales find wide use commercially, where use of automated manufacturing techniques requires extremely tight tolerances on component positioning. The other advantage of a larger scale is reduced eyestrain. For our purposes, the 1x scale is probably best since materials cost is lowest and the need for photoreduction facilities is alleviated. Therefore, your grid should have 20 lines per inch to allow component placement to the nearest 0.05 inch. You might find a grid with 10 lines per inch adequate, but many lead spacings do not fit exactly on a 0.1 inch grid, and you will quickly tire of trying to visually approximate the halfway mark.

The printed circuit design template helps you draw resistors, capacitors, diodes, transistors, integrated circuits, trimmers and edge fingers accurately and repetitively. Be sure you get the 1x size.

A light table is necessary to light your grid from the back and make the grid lines visible through the vellum. Commercial light tables are available, but they are not inexpensive. A homemade substitute can be as simple as a piece of Plexiglas leaning against a box on a table with an incandescent or fluorescent desk lamp providing the illumination (see figure 1). Should you use an incandescent lamp, a low wattage is recommended to minimize heating of the grid.

A pad of scratch paper should be kept handy for sketching of trial layouts, quick computations, doodles, etc.

I use Scotchbrand Magic transparent tape; it is the only readily available tape I have found that will hold the grid and artwork in place on the light table without oozing or creeping due to the heat of the light.

These materials along with your schematic and related pertinent data are all you need to lay out a printed circuit board.

Table 2 outlines the layout strategies I follow in order of execution by heading, and in order of relative importance by subheading.

Initially, you should study your schematic to identify functional groups of components. Carry this out to as detailed a level as you are able. The procedure will

<ul style="list-style-type: none"> ● Divide circuit into functional groups. ● Define board interface. ● Calculate board size. ● Trial position integrated circuits. <ol style="list-style-type: none"> 1. Locate analog circuitry close to interface. 2. Group components by functional groups. 3. Arrange circuits symmetrically around shared integrated circuits. 4. Arrange functional groups to minimize number of interconnects. <ul style="list-style-type: none"> ● Position other Components. <ol style="list-style-type: none"> 1. Keep analog traces short with inputs separated from outputs. 2. Provide supply bypassing at each linear and TTL integrated circuit and at any other circuitry sensitive to supply noise or circuitry generating fast edges. <ul style="list-style-type: none"> ● Don't crowd components. ● Route traces. <ol style="list-style-type: none"> 1. Shortest runs first. 2. Runs local to functional group. 3. Inter-group runs. 4. Runs to interface. 5. Power runs last. <ul style="list-style-type: none"> ● Check spacings. 	<p>} Avoid blocking power and ground pins.</p>
--	---

Table 2: Some printed circuit board layout strategies.

enhance your understanding of the circuit in general as well as the interrelations among subcircuits and the correspondence between circuits and components that influence your design. Additionally, you may be able to define critical areas at this time, such as the need for shielding, isolation, or heat removal. Be sure that all unused logic inputs and nonstandard supply pinouts are explicitly included in your schematic.

Your board interface is a definition of how signals connect to and from the printed circuit board. The interface may be configured as edge connections, solder pads for single leads or ribbon cable, a special connector, or any combination of these. Your system's physical design may place constraints on the locations of the interface connections. If your system is so large that a single board implementation is impractical, or if your system is being constructed modularly, you should define macrofunctions or subsystems into which your overall system can be partitioned. First, define a system by which individual boards can be interconnected. Then, treating each partition as a complex component, define any requirements for shielding, isolation, or heat removal. You may want to consider using a printed circuit backplane or mother board to make system interconnections (see figure 2). The mother board is a good place to locate your power supply and front panel controls if you want a truly modular system.

Now calculate the board size. An ab-

About the Author

David Lamkins is a twenty-three year old consultant in the analog and digital electronics field, and has been working since 1974 on a digital electronic music system. David's hobbies also include playing the guitar and reading science fiction.

Figure 2: A typical arrangement of printed circuit boards used for large circuit designs. Several "daughter" boards are shown plugged into a "mother" board. The latter is used to facilitate board interconnections and reduce wiring to a minimum.

Table 3: Average printed circuit board areas taken up by commonly used electronics components.

solute minimum figure can be obtained by calculating the total area occupied by components (table 3). In practice, you will never achieve this minimum figure with a double sided board, but it is helpful to know how much component area you have. A more realistic figure to start with is 2 to 3 square inches per integrated circuit, tending toward the higher side if the board has many discrete components, large passive components, or a large number of edgeboard IO pins. If the board is constrained to be a certain size, you will have to try to make it all fit, although it could be very difficult if you have much less than 2 square inches per integrated circuit.

Now, take a sheet or two from your scratch pad and sketch a few trial arrangements for your integrated circuits. There are several things you should strive for. Most important is to locate any analog circuitry close to its associated board interface. This minimizes any adverse effects due to coupling or feedback that could be caused by long analog lines. Next is the arrangement of components by functional groups. If a multi-

Component Type	Board Area (Square Inches)

TARBELL SETS STANDARDS

For Hobbyists and Systems Developers

Sales to thousands of hobbyists over the past two years have proven the Tarbell Cassette Interface to be a microcomputer industry standard. Tarbell Electronics continues research and development to produce new and efficient components to fill hobbyists' changing needs.

TARBELL CASSETTE INTERFACE

- Plugs directly into your IMSAI or ALTAIR*
- Fastest transfer rate: 187 (standard) to 540 bytes/second
- Extremely Reliable—Phase encoded (self-clocking)
- 4 Extra Status Lines, 4 Extra Control Lines
- 37-page manual included
- Device Code Selectable by DIP-switch
- Capable of Generating Kansas City tapes also
- No modification required on audio cassette recorder
- Complete kit \$120, Assembled \$175, Manual \$4
- Full 6 month warranty on kit and assembled units

TARBELL FLOPPY DISC INTERFACE

- Plugs directly into your IMSAI or ALTAIR* and handles up to 4 standard single drives in daisy-chain.
- Operates at standard 250K bits per second on normal disc format capacity of 256K bytes.
- Works with modified CP/M* Operating System and BASIC-E Compiler.
- Hardware includes 4 extra IC slots, built-in phantom bootstrap and on-board crystal clock. Uses WD 1771 LSI Chip.
- Full 6-month warranty and extensive documentation.
- PRICE:
Kit \$190 Assembled \$265

CP/M with BASIC-E
and manuals: \$100

Compatible Disc Drives

Ask about our disc drives priced as low as \$525.

TARBELL PROTOTYPE BOARD Model 1010

- Gold plated edge pins
- Takes 33 14-pin ICs or
- Mix 40-pin, 18-pin, 16-pin and 14-pin ICs
- Location for 5 volt regulator
- Suitable for solder and wire wrap
- ALTAIR/IMSAI compatible
- Price: \$28.00

For fast, off the shelf delivery, all Tarbell Electronics products may be purchased from computer store dealers across the country. Or write Tarbell Electronics direct for complete information.

950 DOVLEN PLACE • SUITE B • CARSON, CALIFORNIA 90746
(213) 538-4251 • (213) 538-2254

Figure 3: Typical routing of conductors on a two sided printed circuit board. Contrasting colors are used to show wire runs on the respective sides of the board. Note the use of the dedicated through-hole.

section integrated circuit is shared by two or more functional groups, try to arrange these groups close to the shared integrated circuit. It is often advantageous to make use of the symmetrical layout of many multisection integrated circuit pinouts. Functional groups should be arranged relative to each other to minimize the number and length of interconnections between groups. If a lot of lines go to an edgeboard connector, try to leave a clear route for them.

Tape the grid to the light table, then tape a sheet of vellum over the grid and proceed to lay out the board. Begin by defining the edges of the board in black pencil. Next, using black pencil and the template, locate the integrated circuits on the board using your best trial sketch as a guide. Leave plenty of space around the integrated circuits, because interconnections can consume a lot of board space.

Try to arrange the integrated circuits in a consistent XY grid to maximize the open paths a trace can follow from here to there. Leave plenty of room around the edges of the board; some of the longer traces are most easily routed there.

Still using template and black pencil, position the discrete components. In analog circuitry, maintain short signal leads and separation between input and output of high gain stages. Be sure to provide adequate bypassing: One bypass capacitor per integrated circuit is not too much. Don't crowd components. Keep in mind that you may need access to integrated circuit pins for servicing, and leave room to adjust trim pots. Also, keep important test points out in the open. Avoid locating small components out of sight below larger, overhanging components, and don't allow components or groups of components to block access to integrated circuit pins. During this process, you may find you'll have to move things around somewhat to fit everything where you want it. This may require some erasing.

Now comes the difficult part. Using red and blue pencils and eraser, draw the traces

on the vellum. Red is used for solder-side runs and blue for component-side runs. Trying things out on scratch paper can save you much erasure.

The shortest traces will be those interconnecting the pins of a single integrated circuit to one another. Do these first. Use red whenever possible to minimize the number of component-side runs. You should be able to get this far without creating any connections that start on one side of the board and finish on the other side (except via a hole used for a component lead). The next longest runs will be interconnections within a functional group: Do these next. If possible, avoid blocking access to integrated circuit power and ground pins.

Next should be runs connecting functional groups together, followed by runs to the edge-board interface, if used. Somewhere along the way you'll have to start using dedicated through-holes to run signals past areas that are blocked in completely (see figure 3). Depending on the complexity of your circuit, you shouldn't really need more than one or two through-holes per integrated circuit on the board.

As you proceed, you'll want to keep track of the connections made. I usually do this by numbering the integrated circuits on the layout, then marking them on the schematic to correspond. As I make a connection, I mark a slash through the lead on the schematic. For circuitry that uses identical sections repeatedly, I simply copy the first section as required.

The last connections are power and ground to the integrated circuits. The practice of saving these connections until last is uncommon, but it reduces drastically the number of dedicated through-holes on a larger board. It's easier to route two or three runs through a jungle of interconnections than it is to individually reroute each trace of that same jungle to go around two or three power runs. At any rate, the power runs should be heavy enough for the type and amount of logic being used. When working with TTL integrated circuits, be aware that some formidable current transients are coupled to ground; be sure to beef up that trace accordingly. CMOS at low speeds is relatively immune to power supply noise.

In routing some of the longer traces, you may think that access to some places is blocked by runs on both sides of the board. In such a case group all the interconnections in one area on one side of the board and move them in one direction; then move the interconnections on the opposite side of the board in that area in the other direction. You now have a clear space between the two

ANNOUNCING!

A computer without communications can only WHISPER. Give a computer a modem and it can SHOUT—to other computers, to time-share systems, to remote terminals, to CBBSs, to your friends with computers, and to devices and places only you can think of.

For a modem connection to be legal in the eyes of the Federal Communications Commission (FCC), it must have an approved Data Access Arrangement (DAA-CBT or CBS) or the modem must be approved for direct connection. The MM-103 accomplishes all the protective functions required by the FCC with a miniaturized, proprietary protective coupler and on-board billing delay and level control. We have thereby saved you, the user, the cost of the DAA.

THE MM-103 DATA MODEM AND COMMUNICATIONS ADAPTER

Unless you need more than one,

it's the last S-100 modem you'll ever have to buy!

FCC APPROVED

Both modem and telephone system interface are FCC approved as "Multifunction Data Equipment" which allows control and sensing of auxiliary equipment.

HIGH QUALITY

-50 dBm sensitivity
Auto answer
Auto originate
Auto dialer with computer-controlled dial rate
61 to 300 baud (anywhere over the long-distance telephone network)- rate selection under computer control
600 baud over local telephone systems
Flexible, software-controlled, maskable interrupt system
Precision dial-tone detector
Phone is answered under software control.

WARRANTY

One year limited warranty
Ten-day unconditional return privilege
Minimal cost, 24-hour exchange policy for units not in warranty

ASSEMBLED & TESTED

Not a kit - FCC registration prohibits kits

groups for routing your connection via a dedicated through-hole (see figure 4a & 4b). At this point, you probably don't want to erase and move all those lines. I use a shorthand method to indicate this rearrangement (see figure 4c).

Once all the traces are drawn in place, make sure you have enough room to route traces through the crowded spots. Signal traces can be as narrow as 0.015 inch, in

Figure 4: Figure 4a illustrates a common printed circuit board problem. The designer wishes to run conductors across a group of existing perpendicular conductor runs. Figure 4b shows how the problem can be solved by using a two sided printed circuit board with two through-holes. Figure 4c is a shorthand notation for the configuration shown in figure 4b. As before, contrasting colors indicate conductors on the respective sides of the board.

fact, you will find this width very easy to work with because tape in this width is extremely flexible. Spacings of 0.050 inch between conductors are easy to achieve. Avoid, if possible, running conductors closer than 0.1 inch to pads where no connection is intended. Leave at least 0.1 inch between a trace and the board edge. If you find you will have too little room for traces in a given area, calculate how much related components will need to move and mark the distance and direction on the vellum.

Congratulations! You now have a design that will be the basis of your tape-on-Mylar artwork master. Table 4 lists those materials necessary for the preparation of the artwork master.

Mylar drafting film comes in sheets and rolls. The price advantage of buying in roll form is slight and the curl of sheets cut from a roll is a nuisance at best.

Black donut pads come 500 to a pack. The 0.093 inch size will work for almost everything, but it's nice to have 0.075 inch pads on hand for the finer leads of transistors and diodes plus 0.111 inch pads to connect lead wires to the board.

I use three tape widths for most of my designs. The 0.015 inch width finds the greatest use. Power and ground runs usually use 0.040 inch or 0.062 inch widths.

Integrated circuit patterns are worth every penny for the time they save. If your requirements are modest, buy just one pack of 16 lead DIP patterns. These can be cut down to make 14 or 8 lead DIP patterns, and they can be split down the middle and arranged to make 24, 28, or 40 lead DIP patterns. Round 8, 10, or 12 lead TO-5 patterns can be accommodated by bending the device leads to fit DIP spacing. I find the 0.075 inch round pad style most suitable. Check the catalogs of the sources listed at the end of this article; many styles are available.

Targets come 250 per package, and, although expensive, are absolutely essential to assure accurate alignment of the three or four layers of artwork.

A drafting pen is used with the printed circuit design template to make an assembly drawing of your board. It will cost about \$7.50 at an art supply store and is truly a joy to own.

Remove your vellum layout sheet from the light table and keep it nearby. Securely tape a Mylar sheet over the grid. Locate two targets in diagonally opposite corners of the Mylar and carefully align the centers with a grid intersection. The targets may be located inside or outside of the board area. If located within the board area, they can

BEYOND TRS-80^{T.M.}

When Microsoft put Level II BASIC on TRS-80, you got a glimpse of its full potential.

Now Microsoft introduces:

TRS-80 Fortran

and TRS-80 will never be the same!

Plus

TRS-80 FORTRAN includes the finest Z-80 development software available:

Z-80 Macro Assembler, versatile Text Editor, and Linking Loader.

Circle 228 on inquiry card.

Total price: Only \$350.00

TRS-80 FORTRAN is supplied on two minidiskettes and requires a 32K system with one disk drive. Dealer Inquiries invited.

MICROSOFT

**10800 NE Eighth, Suite 819
Bellevue, WA 98004**

Figure 5: Two techniques for applying drafting tape around corners. Figure 5a shows the preferred method for narrow traces; figure 5b shows the technique for wide traces.

0.075 inch pad	#71 drill
0.093 inch pad	#64 drill
0.111 inch pad	#55 drill
0.125 inch pad	1/16 inch drill

Table 5: Recommended drill sizes for drilling standard printed circuit board pad holes.

double later as mounting holes. Define the board edges with short pieces of tape at the board's corners.

Now, working with a ruler marked in tenths of an inch and your vellum layout, transfer the component and through-hole locations to the Mylar using donut pads and stick-ons. Be sure to take into account the shifts notated as the last step of the layout preparation. Once all the components and through-holes appear as pad groups on the Mylar, align the vellum over the Mylar and check for missing or misplaced pads. This sheet now contains all the component pads that will appear on both sides of the board. Remove the vellum.

Tape a second sheet of Mylar directly over the first. Align targets with those on the first sheet. Using black tape, transfer all the lines appearing in red on the vellum to this sheet of Mylar. Take heed of any notes on the vellum to shift traces from their indicated positions. Narrow tapes are best routed directly with gentle corners where necessary. Wider tapes do not curve as easily and require cut corners for sharp bends (see figure 5). This sheet now contains all traces located on the solder side of the board. There are no pads on this sheet. The same procedure is followed using a third Mylar sheet and the blue lines for the component side traces.

For the sake of completeness, you should now make an assembly drawing on a fourth layer of Mylar sheet. This is done using the template by inking the component outlines aligned with their respective pads. The

component designation or value should be included within or beside the outline using pen and ink or dry transfer lettering.

Your master artwork is now complete and should be rechecked for accuracy.

To make negatives of solder-side and component-side artwork for use in photographically etching your board, simply align the Mylar sheet containing only pads with either of the sheets containing only traces before making a contact negative. The details of the negative-producing operation are well covered in the hobbyist magazines, and most local electronics stores sell printed circuit board etching kits.

You now have a negative for each side of your printed circuit board. Before coating your board with photoresist, pick two holes near diagonally opposite corners and accurately transfer their locations to the laminate. Use a very small drill to make these two holes. You now have reference points by which you can align the negative on each side of the board. The board is now photo etched on both sides.

All that remains is to drill the holes, mount the components, and solder the leads. Table 5 shows recommended drill sizes for various sizes of pads. When mounting components, crimp the leads flat against the solder side. Dedicated through-holes are stuffed with a short piece of wire crimped to the board on both sides. Solder leads on both sides of the board where necessary for through-board connections. As an alternative to soldering on both sides, you can crimp eyelets in the holes or get someone to process your board with plated through-holes.

Well, that's all there is to it. Now you can put that very large project of yours on a printed circuit board. (The very first printed circuit board I ever designed had 26 integrated circuits, 144 resistors, 44 capacitors, 28 transistors, 30 diodes, and 23 indicators. I completed the master artwork using the techniques I have just described in less than 40 hours.) A homebrew double sided printed circuit board may be just the solution you're looking for. ■

ANNOUNCES DDS II

THE FAMOUS OPEN-HEART SURGEON FOR MICROCOMPUTERS

DDS II IS AN INCREDIBLY POWERFUL LEARNING AND DEBUGGING SYSTEM

DDS II the famous Dynamic Debugging System is an incredibly powerful, learning and debugging system. Although designed for microcomputers, it is even more sophisticated than the built-in debugging environments supported by most large main frames. DDS II is a remarkably expanded version of DDS I. And with its 50 commands, DDS II is much different from DDT.

A FEW OF DDS II'S MANY FEATURES

- Assembles and disassembles all 8080 code for fast and easy patching.
- Performs "software open-heart surgery" on the microprocessor and the memory, artfully displaying on the screen all registers, program instructions and memory.
- Simulates dual screen capability by offering you the ability to switch on command from the DDS II display to the program output. It's like having two video monitors for the price of one.
- Updates the display while monitoring every step of the program.
- Offers alteration at will of all registers, instructions or memory.
- Includes a full array of monitoring tools, e.g., breakpoints, conditional stops, stack range errors, etc.
- Comes in different versions running on either the VDM videoboard or the Lear Siegler ADM 3A.

DDS II'S EXTRA BENEFIT FOR BEGINNERS

DDS II is an ideal tool to learn how to write assembly language programs. It is like a window exposing the inner workings of your computer.

PRs DDS II comes with a complete and instructive handbook explaining every procedure step by step. This unique documentation is written in clear and easy-to-understand English and avoids esoteric technical language.

But PRs documentation for DDS II is more than clear and precise instructions in a graphically appealing manual. You learn at the same time.

Indeed, PRs DDS II documentation offers you a true fluency in computer-user dialogue.

DDS II IS PROTECTED IN A BEAUTIFUL CASSETTE OR DISK FOLDER

The PRs cassette (or floppy disk) and manual for your DDS II program are protectively nestled in an efficient and durable gold-imprinted folder. Wherever you file it, in your room or office, the decor will be enhanced by its elegance.

DDS II FROM PRs IS SUPPORTED BY MAJOR BRANDS

- CUTS relocatable cassette VDM version:

runs with SOLOS/ CUTER monitor; or ADM3A version: runs with SOLOS/ CUTER monitor on the Lear Siegler ADM3A terminal.

- XITAN (TDL) relocatable cassette VDM or ADM3A version: interfaced to ZAPPLE monitor and VDM board or the Lear Siegler ADM3A terminal
- TARBELL VDM or ADM3A cassette version: interfaced to the APPLE monitor (8080A version of ZAPPLE) and VDM board or the Lear Siegler ADM3A terminal.
- CP/M 8" single density floppy disk VDM version or ADM3A version
- CP/M 5 1/4" MICROPOLIS floppy disk VDM version or ADM3A version
- CP/M 5 1/4" NORTH*STAR floppy disk VDM version or ADM3A version

IMPORTANT NOTE:

DDS II can easily be patched to run with other DMA videoboards or other cursor addressed video terminals.

AN AD CAN NOT DO JUSTICE TO DDS II You must run it to appreciate its completeness.

VISIT YOUR NEAREST DEALER TODAY TO OBTAIN YOUR DDS II FROM PRs FOR ONLY \$49.95 PER CASSETTE OR \$64.95 PER DISK

Let your dealer demonstrate the excellence of PRs DDS II. Use the coupon below to obtain the name of a dealer in your area.

NEWS FLASH
Modified CP/M
for TRS-80
now available

Our Micro
iCOM CP/M
has 78K
storage
per drive

**New CP/M
implementations:**
Double Density
North Star
Helios, Altair,
Micro and 8" iCOM

Software / Manual
with / Alone

DIGITAL RESEARCH

- CP/M FDOS** — Diskette Operating System complete with Text Editor, Assembler, Debugger, File Manager and system utilities. Available for wide variety of disk systems including North Star, Helios II, Micropolis, iCOM (all systems) and Altair. Supports computers such as Sorcerer, Horizon, Sol System III, Versatile, Altair 8800, COMPAL-80 and iCOM Attache. Specify desired configuration **\$145/\$25**
- MAC** — 8080 Macro Assembler. Full Intel macro definitions. Pseudo Ops include RPC, IRP, REPT, TITLE, PAGE, and MACLIB. Z-80 library included. Produces Intel absolute hex output plus symbols file for use by SID (see below) **\$100/\$15**
- SID** — 8080 symbolic debugger. Full trace, pass count and break-point program testing system with back-trace and histogram utilities. When used with MAC, provides full symbolic display of memory labels and equated values **\$85/\$15**
- TEX** — Text formatter to create paginated, page-numbered and justified copy from source text files, directable to disk or printer **\$85/\$15**
- DESPOOL** — Program to permit simultaneous printing of data from disk while user executes another program from the console **\$50/\$1**

MICROSOFT

- Disk Extended BASIC*** — New version, ANSI compatible with long variable names, WHILE/WEND, chaining, variable length file records **\$300/\$25**
- FORTRAN-80*** — ANSI '66 (except for COMPLEX) plus many extensions. Includes relocatable object compiler, linking loader, library with manager. Also includes MACRO-80 (see below) **\$400/\$25**
- COBOL-80*** — ANSI '74 Pseudo-compiler with relocatable object runtime package. Format same as FORTRAN-80 and MACRO-80 modules. Complete ISAM, interactive ACCEPT/ DISPLAY, COPY, EXTEND **\$625/\$25**
- MACRO-80** — 8080/Z80 Assembler. Intel and Zilog mnemonics supported. Relocatable linkable output. Loader, Library Manager and Cross Reference List utilities included **\$149/\$15**
- MACRO-80 plus FORTRAN** subroutine library available. Library includes ABS, SIGN, EXP, DLOG, SQRT, ATAN, DATAN etc. etc. **\$219/\$15**
- EDIT-80** — Very fast random access text editor for text with or without line numbers. Global and intra-line commands supported. File compare utility included **\$89/\$15**

*See MICROPRO for Microsoft languages with sort capabilities

XITAN (software requires Z-80 CPU)

- Disk BASIC** — Fast powerful interactive interpreter. PRIVACY password security. Can dynamically open a large number of files simultaneously for random or sequential I/O **\$159/\$20**
- Z-TEL** — Text editing language. Expression evaluation iteration and conditional branching ability. Registers available for text and commands. Macro command strings can be saved on disk for re-use **\$69/\$20**
- ASM Macro Assembler** — Mnemonics per Intel with Z-80 extensions. Macro capabilities with absolute Intel hex or relocatable linkable output modules **\$69/\$20**
- LINKER** — Link-edits and loads ASM modules **\$69/\$20**
- Z-BUG debugger** — Trace, break-point tester. Supports decimal, octal and hex modes. Disassembler to ASM mnemonic set. Emulation technique permits full tracing and break-point support through ROM **\$89/\$20**

TOP Text Output Processor — Creates page-numbered, justified documents from source text files. Available only as part of A3 or A3+ package.

- SUPER BASIC** — Sub-set of Xitan Disk BASIC with extensive arithmetic and string features but without random access data file support. Available optionally with features to support VDB Xitan video output board **\$99/\$20**
- A3 package** includes Z-TEL, TOP, ASM and Super BASIC **\$249/\$40**
- A3+ package** includes Disk BASIC, Z-TEL, TOP, ASM, Z-BUG and LINKER **\$409/\$40**

MICROPRO

- Super Sort I** — Sort, merge, extract utility as absolute executable program or linkable module in Microsoft format. Sorts fixed or variable records with data in binary, BCD, Packed Decimal, EBCDIC, ASCII, floating, fixed point, exponential, field justified, etc. etc. Even variable number of fields per record! **\$250/\$25**
- Super Sort II** — Above available as absolute program only **\$200/\$25**
- Super Sort III** — As II without SELECT/EXCLUDE **\$150/\$25**
- ISAM** — Callable system with triple level index full ANSI level II COBOL capability. Utility included to convert existing sequential files to ISAM **\$145/\$25**
- Word Master Text Editor** — In one mode has super-set of CP/M's ED commands including global searching and replacing, forward and backwards in file. In video mode, provides full screen editor for users with serial addressable-cursor terminal **\$150/\$25**
- Corresponder** — Mail list system, supporting form letter generation with personalized greetings. Reference fields permit sorting and extraction by name, address fields or reference data using Super Sort. Requires CBASIC **\$95/\$25**
- BASIC/S** — Microsoft BASIC with Super Sort Capability **\$400/\$25**
- FORTRAN/S** — Microsoft FORTRAN-80 with Super Sort capability **\$550/\$25**
- COBOL/S** — Microsoft COBOL-80 with Super Sort capability **\$800/\$25**

SOFTWARE SYSTEMS

- CBASIC Disk Extended BASIC** — Non-interactive BASIC with pseudo-code compiler and runtime interpreter. Supports full file control, chaining, integer and extended precision variables etc. Version 1 users can receive Version 2 and new manual for \$45 with return of original diskette . **\$95/\$15**

STRUCTURED SYSTEMS GROUP

- General Ledger** — Interactive and flexible system providing proof and report outputs. Customization of COA created interactively. Multiple branch accounting centers. Extensive checking performed at data entry for proof, COA correctness etc. Journal entries may be batched prior to posting. Closing procedure automatically backs up input files. All reports can be tailored as necessary. Requires CBASIC **\$995/\$20**
- Accounts Receivable** — Open item system with output for internal aged reports and customer-oriented statement and billing purposes. On-Line Enquiry permits information for Customer Service and Credit departments. Interface to General Ledger provided if both systems used. Requires CBASIC **\$750/\$20**
- NAD Name and Address selection system** — Interactive mail list creation and maintenance program with output as full reports with reference data or restricted information for mail labels. Transfer system for extraction and transfer of selected records to create new files. Requires CBASIC **\$79/\$20**

Our Altair
CP/M has 315K

All
Microsoft
prices are
discounted!

Filled out any huge coupons lately? Here's your chance. Check off the items you want, furnish all of the necessary information and send us this whole advertisement. Big coupon ... big values ... big savings, from Lifeboat Associates, your Software Supermarket.

QSORT — Fast sort/merge program for files with fixed record length, variable field length information. Up to five ascending or descending keys. Full back-up of input files created. Parameter file created, optionally with interactive program which requires CBASIC. Parameter file may be generated with CP/M assembler utility **\$95/\$20**

OTHER

- WHATSIT** — Interactive data-base system using associative lags to retrieve information by subject. Hashing and random access used for fast response. Requires CBASIC. **\$125/\$25**
- SOURCE 8080/Z-80 Disassembler** — Disassembles disk binary file to disk source files. Output may be created for processing by MAC with its Z-80 library or by the Xitan ASM **\$70/\$1**
- ZASM Assembler** — Disk-based assembler for Zilog/Mostek mnemonic Z-80 code. Creates output in absolute Intel hex. Requires Z-80 to operate **\$45/\$10**
- XYBASIC Interactive Process Control BASIC** — Full disk BASIC features plus unique commands to handle bytes, rotate and shift, and to test and set bits. Available in Integer, Extended and ROMable versions **From \$295/\$25**
- SMAL/80 Structured Macro Assembler Language** — Package of powerful general purpose text macro processor and SMAL structured language compiler. SMAL is an assembler language with IF-THEN-ELSE, LOOP-REPEAT-WHILE, DO-END, BEGIN-END constructs **\$75/\$15**

Software with Manual Alone

Selector II — Data Base Processor to create and maintain single Key data bases. Prints formatted, sorted reports with numerical summaries. Available for Microsoft and CBASIC (state which). Supplied in source code **\$195/\$20**

Selector III — Multi (i.e., up to 24) Key version of Selector II. Comes with applications programs including Sales Activity, Inventory, Payables, Receivables, Check Register, Expenses, Appointments, and Client/Patient. Requires CBASIC. Supplied in source code **\$295/\$20**

BASIC Comparison — A comprehensive features and performance analysis of five 8080 disk BASIC languages — CBASIC, BASIC-E, XYBASIC, Microsoft Disk Extended BASIC, and Xitan's Disk BASIC. Itemizes results of 21 different benchmark tests for speed and accuracy and lists instructions and features of each BASIC (send 20¢ S.A.S.E.) **FREE**

Software with Manual Alone

★ TRS-80 FORTRAN PACKAGE ★
Professional Disk-Based Language and Utility Package

Written by Microsoft, creators of Level II BASIC, the package runs on a TRS-80 system with 32K RAM, one or more drives and TRSDOS. The software is supplied on diskettes and consists of a relocatable machine code FORTRAN Compiler, Macro Assembler, a Linking Loader, Subroutine Library, Text Editor **\$325**

Fill it in.

All software requires CP/M for operation except TRS-80 FORTRAN

“My Structured Systems business software has paid for itself in labor hours saved alone.”

Mr. Ken Tunnah, Colloid-A-Tron Inc., Buffalo, New York

Ken Tunnah is one of many innovators bringing the micro revolution to the small business. As a programmer, he knows computers and their languages. As a businessman, he knows business and its languages. And when Mr. Tunnah decided to micro-computerize the accounting function at Colloid-A-Tron, he turned to Structured Systems software.

Says Mr. Tunnah: *“The program is designed from a CPA standpoint, for multiple corporations, which we have. It is flexible and gives me the ability to change reporting by profit centers easily. It is up and running quickly, and it just keeps on running. I think it’s the best business software available.”*

The best software available. That’s what Structured Systems Group set out to create.

Structured Systems offers three sophisticated accounting systems. Our General Ledger software is big enough for multi-client write-up by the CPA, or multi-corporate reporting for the business, but small enough for the micro budget. The very comprehensive Accounts Receivable and Accounts Payable packages will operate independently, or they will coordinate with the General Ledger.

Our systems record transactions easily and correctly, and provide an audit trail from source document to financial statements. And they will maintain monthly and year-to-date information in

dollars and in percentages. And they are reliable.

The three systems interact with the user to set up parameters such as format and headings, account titles and numbering, automatic billing or reminder notices, credit limits, sales reports, a check register, and much more.

The software is designed to run on an 8080 or Z-80 CPU with 48K of memory, dual disks with CP/M[®], printer, keyboard, and CRT. To make it all work for you, we have provided the most extensive documentation and support in the industry.

We provide the capability to computerize complex accounting functions on relatively inexpensive micro-computer equipment. Ken Tunnah has told us what that means: *“I’ve bucked some trends. I looked around, and decided that with the right software, I could get a micro to outperform a \$45,000 mini. I’m satisfied. It’s simple economics.”*

We can refer you to a growing number of sophisticated retailers experienced in Structured Systems Group business systems. Or we can work directly with you. We’d be happy to provide you with more information on our product line, which includes QSORT (a sort/merge program), CBASIC (a business BASIC), NAD (a mailing and addressing system), and our General Ledger, Accounts Receivable, and Accounts Payable packages.

BYTE News....

MORE COMPANIES JUMPING ON THE PASCAL BANDWAGON. The list of computer manufacturers committing themselves to support Pascal on their systems is growing rapidly. The list now includes American Microsystems (AMI) on their 6800 based system, Western Digital Corp on their 16 bit Pascal oriented microprocessor, National Semiconductor on their SC/MP-II, General Automation on their 16 bit microprocessor, Apple on their 8 bit microcomputer and, soon, Intel, on their 8080/8085 development system.

INTEL, TEXAS INSTRUMENTS AND IBM MAKE MEMORY NEWS. Intel has again beat its competitors to the marketplace with a new product. This time it is the 32 K byte programmable read only memory, called the 2732, following in the footsteps of the 2716 and the 2708. It is pin compatible with the 2716 16 K erasable byte read only memory, and is organized as 4 K by 8 bit words. It has a 450 ns access time and operates from a single 5 V power supply. Further, a separate chip-enable input reduces power dissipation by 80 percent (from 150 mA to 30 mA) when the device is not selected. The single unit price is \$147.30 and drops to \$91.65 in quantity. Intel claims the 2732 is now available in production quantities.

Texas Instruments has been sampling their new 64 K bit dynamic programmable memory (TMS-4164) since last fall to selected customers and expects to be in quantity production by the last quarter of this year. Motorola also recently began sampling their 64 K bit programmable memory and hopes to be in production by year-end (initial price is \$130).

IBM, at a recent International Electron Devices meeting, disclosed that they had made an experimental MOS gate with channel lengths of 1.3 to 1.0 micrometers. This represents a significant breakthrough in very large scale integrated (VLSI) circuit technology. Using this technology it is now possible to build a 256 K bit memory part. Further, IBM reports that these devices have switching times of 230 picoseconds, which is three to four times faster than previous MOS circuits, and dissipate one tenth the power.

BUBBLE MEMORIES INCREASING IN AVAILABILITY. Texas Instruments and Rockwell are currently the only two manufacturers of bubble memories and their maximum size devices are only 256 K bits. National Semiconductor is expected to start sampling their 256 K device later this year. Also, look for Intel to enter the market before year-end. However, prices are still very high, compared to disk storage technology, and production is still very limited. Don't look for their use in microcomputers until the early 1980s, when bit capacity is up in the megabyte size and competition develops. Currently, bubble memories are being used in applications where the electro-mechanical disk systems are not rugged enough.

FLOPPY DISK IMPROVEMENTS COMING. Floppy disks are going to be with us for some time to come. It is expected that next year will see the introduction of 5 to 10 M byte floppy disks due to higher track density. This will be made possible by having the disk supply its own track positioning data and by improvements in media technology, allowing for narrower tracks. 5 inch floppies will be expanded to the 1 to 2 M byte range, per disk.

Projections for 1980 are that bubble memory will drop to 0.1 cent per bit while disk will cost 0.0001 cent per bit. Further, projections are for bubble memory prices to drop to only 0.02 cent per bit by 1985.

In the meantime, floppy disks, first introduced in 1973, saw sales of close to 270,000 units last year with sales for this year expected to be over 350,000.

FLAT SCREEN TERMINALS ARE COMING. General Telephone and Electronics (GT&E) has announced that they are far along in development of a flat screen display using cathodoluminescence. They are working on it jointly with Lucitron Inc. GT&E predicts that the display will be in production by 1981 at the latest. A color display, using the same technique, is also being developed. The system will permit large displays, up to 50 inches (127 cm, measured diagonally) and approximately three inches thick. The Lucitron panels use a "self-scanning" system which does not require complex drive circuitry. The initial display panels will be used for computer terminals, with television type displays, providing good gray scale, following a year or two later.

APL ON A MICROCOMPUTER FOR \$2000 AVAILABLE SOON. APL buffs waiting patiently for a home APL system will finally get their dream. Alan Rose, of Scientific Time-Sharing Corp, considered one of the APL authorities, reports that he and a small company called Quark will soon introduce a microcomputer system dedicated to APL. It will run the full APL language, as implemented by IBM and Scientific Time-Sharing Corp. It will be easily expandable in I/O and peripheral mass storage and will execute two to four times faster than the IBM 5100 APL machine. The unit, which will use the Intel 8086 16 bit processor, will contain its own keyboard and display and can be used in either a stand-alone mode or as an intelligent APL terminal to a host system. The best news is that the system price will start at only \$2000. Look for availability this summer.

Although several "tiny APL" interpreters have been brought out for microcomputers, and IBM has a micro-APL in their 5100 desktop computer, these implementations have left a great deal to be desired. Vanguard Systems in Austin TX has available an excellent Z-80 APL interpreter which we understand will be licensed soon to one or more computer manufacturers. Microsoft had advertised their version of APL for some time, but as far as we know have not started delivery yet.

FCC TAKING ACTION ON RADIATING COMPUTERS AND GAMES. After severe interference problems that occurred with Citizen's Band radio interference on television sets, the FCC sought to regulate devices which employ radio frequency modulators. This is also the case with computers and electronic games that are connected to standard television sets via radio frequency modulators. Manufacturers are required to submit their units to the FCC for approval and licensing. Passing the standards appears quite difficult and so far only a few units have obtained approval. Several manufacturers have gotten around the problem by providing only video signal output, which means that the user must use a video monitor or TV set with special video input. Some manufacturers have ignored the FCC regulations and sold unlicensed units.

Recently the FCC served a cease-and-desist order on some personal computer system owners because of interference on neighbors sets. The FCC is also talking about imposing marketing sanctions on those companies who fail to meet interconnect qualifications.

PERSONAL COMPUTERS GOING GREAT IN EUROPE. Sales of personal computer systems are going great on the Continent. The Germans report that sales are soaring. An estimated 4000 PETs were sold in 1978, primarily to home users. Commodore is manufacturing the PET in England. Tandy also reports greater than expected sales, but has not disclosed figures. Tandy started selling the TRS-80 last summer through 340 stores. In Germany the TRS-80 (Level I) sells for \$935 compared to \$595 in the states. The Apple computer is being handled by ITT, who reports excellent sales. The TRS-80 and Apple are manufactured in the USA. Things will change this year as Seimens, one of the largest European electronics manufacturers, will soon announce their own personal computer system.

Interestingly, one of the major sales outlets for personal computer systems has become department stores. Several US department stores have tried selling personal computer systems but have withdrawn.

MICROPROCESSOR MAKERS MOVE INTO COMPUTER SYSTEMS BUSINESS. Integrated circuit manufacturers are going into competition with their customers, the computer systems manufacturers. Texas Instruments was one of the first. They have been selling complete minicomputer systems for several years now. Additionally, they have seen selling 16 bit systems using their 9900 processor and now also will soon introduce a personal computer system using the 9900.

National Semiconductor is now selling a large system to replace IBM-370s and will soon offer for sale a micro-processor version of the DEC PDP-11 16 bit computer system. Also, Fairchild will soon sell a system that is compatible with the Data General NOVA computer system.

Zilog late last year introduced their system using the Z-80. It is a business-oriented system and has a full complement of computer languages, including BASIC, FORTRAN and COBOL; business application software packages are also offered. A Z-8000 based system is expected in the fall.

Intel is rumored to be working on a very powerful data base system using an associative processor to handle searching, inserting, deleting, etc, among an array of storage devices and host interfaces. The system will utilize a 16 bit processor and CCD memory that will represent a breakthrough in data base computer technology. Introduction is expected in 1980.

TANDY REVAMPS ITS COMPUTER MARKETING. Early last year Tandy opened a computer store in its Fort Worth TX building complex and also issued a computer catalog. The store and the catalog carried the Radio Shack TRS-80 and a wide variety of products ranging from the IMSAI 8080 to the Video Brain computers. Tandy considered it an experiment. The TRS-80 accounted for 80 percent of the sales. Now Tandy has decided on a new marketing approach. They have already opened five computer stores (Richardson, Dallas and Fort Worth TX, and New York City and Washington DC) and plans to open others soon in Tampa, Atlanta, San Francisco and Los Angeles. Each store will have a classroom and repair facilities.

Further, the stores will carry only three different computer systems. The TRS-80, Tandy-10 and Tandy-150 systems. The Tandy-10 is made for Tandy by Digital Data Systems (DDS) and will have a base price of \$8995. Using an 8080, it will have a video display, keyboard, 48 K bytes of programmable memory, two 8 inch floppy disk drives, BASIC and a disk operating system similar to CP/M. The initial order placed by Tandy with DDS was reportedly for 250 systems. The Tandy-150 will be assembled by Tandy and use a Computer Automation 16 bit processor. Starting at \$21,995, it will include a 10 M byte hard disk.

"BOOKS OF INTEREST TO COMPUTER PEOPLE"

**More BYTE BOOKS
in your future...**

...And the future

THE BYTE BOOK OF COMPUTER MUSIC combines the best computer music articles from past issues of *BYTE* Magazine with exciting new material—all written for the computer experimenter interested in this fascinating field.

You will enjoy Hal Chamberlin's "A Sampling of Techniques for Computer Performance of Music", which shows how you can create four-part melodies on your computer. For the budget minded, "A \$19 Music Interface" contains practical tutorial information—and organ fans will enjoy reading "Electronic Organ Chips For Use in Computer Music Synthesis".

New material includes "Polyphony Made Easy" and "A Terrain Reader". The first describes a handy circuit that allows you to enter more than one note at a time into your computer from a musical keyboard. The "Terrain Reader" is a remarkable program that creates random music based on land terrain maps.

Other articles range from flights of fancy about the reproductive systems of pianos to Fast Fourier transform programs written in BASIC and 6800 machine language, multi-computer music systems, Walsh Functions, and much more.

For the first time, material difficult to obtain has been collected into one convenient, easy to read book. An ardent do-it-yourselfer or armchair musicologist will find this book to be a useful addition to the library.

SUPERWUMPUS is an exciting computer game incorporating the original structure of the *WUMPUS* game along with added features to make it even more fascinating. The original game was described in the book *What To Do After You Hit Return*, published by the People's Computer Company. Programmed in both 6800 assembly language and BASIC, **SUPERWUMPUS** is not only addictively fun, but also provides a splendid tutorial on setting up unusual data structures (the tunnel and cave system of **SUPERWUMPUS** forms a dodecahedron). This is a **PAPERBYTE™** book.

ISBN 0-931718-03-1
Author: Jack Emmerichs
Pages: 56
Price: \$6.00

TINY ASSEMBLER 6800, Version 3.1 is an enhancement of Jack Emmerichs' successful *Tiny Assembler*. The original version (3.0) was described first in the April and May 1977 issues of *BYTE* magazine, and later in the **PAPERBYTE™** book **TINY ASSEMBLER 6800 Version 3.0**.

In September 1977, *BYTE* magazine published an article entitled, "Expanding The *Tiny Assembler*".

This provided a detailed description of the enhancements incorporated into Version 3.1, such as the addition of a "begin" statement, a "virtual symbol table", and a larger subset of the Motorola 6800 assembly language.

All the above articles, plus an updated version of the user's guide, the source, object and **PAPERBYTE™** bar code formats of both Version 3.0 and 3.1 make this book the most complete documentation possible for Jack Emmerichs' *Tiny Assembler*.

A walk through this book brings you into **Ciarcia's Circuit Cellar** for a detailed look at the marvelous projects which let you do useful things with your micro-computer. A collection of more than a year's worth of the popular series in *BYTE* magazine, **Ciarcia's Circuit Cellar** includes the six winners of *BYTE*'s On-going Monitor Box (BOMB) award, voted by the readers themselves as the best articles of the month: **Control the World** (September 1977), **Memory Mapped IO** (November 1977), **Program Your Next EROM in BASIC** (March 1978), **Tune In and Turn On** (April 1978), **Talk To Me** (June 1978), and **Let Your Fingers Do the Talking** (August 1978).

Each article is a complete tutorial giving all the details needed to construct each project. Using amusing anecdotes to introduce the articles and an easy-going style, Steve presents each project so that even a neophyte need not be afraid to try it.

is right now!

BASEX, a new compact, compiled language for microcomputers, has many of the best features of BASIC and the 8080 assembly language—and it can be run on any of the 8080 style microprocessors: 8080, Z-80, or 8085. This is a **PAPERBYTE™** book.

Subroutines in the **BASEX** operating system typically execute programs up to five times faster than equivalent programs in a BASIC interpreter—while requiring about half the memory space. In addition, **BASEX** has most of the powerful features of good BASIC interpreters including array variables, text strings, arithmetic operations on signed 16 bit integers, and versatile IO communication functions. And since the two languages, **BASEX** and BASIC, are so similar, it is possible to easily translate programs using integer arithmetic data from BASIC into **BASEX**.

The author, Paul Warme, has also included a **BASEX** Loader program which is capable of relocating programs anywhere in memory.

PROGRAMMING TECHNIQUES is a series of **BYTE BOOKS** concerned with the art and science of computer programming. It is a collection of the best articles from **BYTE** magazine and new material collected just for this series. Each volume of the series provides the personal computer user with background information to write and maintain programs effectively.

The first volume in the **Programming Techniques** series is entitled **PROGRAM DESIGN**. It discusses in detail the theory of program design. The purpose of the book is to provide the personal computer user with the techniques needed to design efficient, effective, maintainable programs. Included is information concerning structured program design, modular programming techniques, program logic design, and examples of some of the more common traps the casual as well as the experienced programmer may fall into. In addition, details on various aspects of the actual program functions, such as hashed tables and binary tree processing, are included.

ISBN 0-931718-12-0
Editor: Blaise W. Liffick
Pages: 96
Price: \$6.00

SIMULATION is the second volume in the **Programming Techniques** series. The chapters deal with various aspects of specific types of simulation. Both theoretical and practical applications are included. Particularly stressed is simulation of motion, including wave motion and flying objects. The realm of artificial intelligence is explored, along with simulating robot motion with the microcomputer. Finally, tips on how to simulate electronic circuits on the computer are detailed.

Publication: Winter 1979

RA6800ML: AN M6800 RELOCATABLE MACRO ASSEMBLER is a two pass assembler for the Motorola 6800 microprocessor. It is designed to run on a minimum system of 16 K bytes of memory, a system console (such as a Teletype terminal), a system monitor (such as Motorola **MIKBUG** read only memory program or the **ICOM** Floppy Disk Operating System), and some form of mass file storage (dual cassette recorders or a floppy disk).

The Assembler can produce a program listing, a sorted Symbol Table listing and relocatable object code. The object code is loaded and linked with other assembled modules using the **Linking Loader LINK68**. (Refer to **PAPERBYTE™** publication **LINK68: AN M6800 LINKING LOADER** for details.)

There is a complete description of the 6800 Assembly language and its components, including outlines of the instruction and address formats, pseudo instructions and macro facilities. Each major routine of the Assembler is described in detail, complete with flow charts and a cross reference showing all calling and called-by routines, pointers, flags, and temporary variables.

In addition, details on interfacing and using the Assembler, error messages generated by the Assembler, the Assembler and sample IO driver source code listings, and **PAPERBYTE™** bar code representation of the Assembler's relocatable object file are all included.

This book provides the necessary background for coding programs in the 6800 assembly language, and for understanding the innermost operations of the Assembler.

ISBN 0-931718-10-4
Author: Jack E. Hemenway
Pages: 184
Price: \$25.00

to order books see next page

LINK68: AN M6800 LINKING LOADER is a one pass linking loader which allows separately translated relocatable object modules to be loaded and linked together to form a single executable load module, and to relocate modules in memory. It produces a load map and a load module in Motorola MIKBUG loader format. The Linking Loader requires 2 K bytes of memory, a system console (such as a Teletype terminal), a system monitor (for instance, Motorola MIKBUG read only memory program or the ICOM Floppy Disk Operating System), and some form of mass file storage (dual cassette recorders or a floppy disk).

It was the express purpose of the authors of this book to provide everything necessary for the user to easily learn about the system. In addition to the source code and PAPERBYTE™ bar code listings, there is a detailed description of the major routines of the Linking Loader, including flow charts. While implementing the system, the user has an opportunity to learn about the nature of linking loader design as well as simply acquiring a useful software tool.

 Price: \$6.00

MONDEB: AN ADVANCED M6800 MONITOR-DEBUGGER has all the general features of Motorola's MIKBUG monitor as well as numerous other capabilities. Ease of use was a prime design consideration. The other goal was to achieve minimum memory requirements while retaining maximum versatility. The result is an extremely versatile program. The size of the entire MONDEB is less than 3 K.

Some of the command capabilities of MONDEB include displaying and setting the contents of registers, setting interrupts for debugging, testing a programmable memory range for bad memory locations, changing the display and input base of numbers, displaying the contents of memory, searching for a specified string, copying a range of bytes from one location in memory to another, and defining the location to which control will transfer upon receipt of an interrupt. This is a PAPERBYTE™ book.

BAR CODE LOADER. The purpose of this pamphlet is to present the decoding algorithm which was designed by Ken Budnick of Micro-Scan Associates at the request of BYTE Publications, Inc., for the PAPERBYTE™ bar code representation of executable code. The text of this pamphlet was written by Ken, and contains the general algorithm description in flow chart form plus detailed assemblies of program code for 6800, 6502 and 8080 processors. Individuals with computers based on these processors can use the software directly. Individuals with other processors can use the provided functional specifications and detail examples to create equivalent programs.

ECONORAM™ DEFINED.

- 4MHz operation guaranteed on high-density (16K and up) boards, with no price penalty
- Low current consumption with guaranteed specs
- Static technology used exclusively
- Buffered inputs for minimum buss loading
- Buffered tri-state outputs for maximum output drive
- Unique multi-block configurations for addressing flexibility
- All memories conform to industry standard board sizes
- 1 year limited warranty (not just 90 days)
- Double-sided, plate through, solder masked and legended circuit board
- Complete documentation
- Gold-plated edge connector teeth that stand up to repeated insertions
- DIP switch address selection/deselection
- Sockets for all ICs, including low power Schottky support chips
- Optimized thermal design
- Over 4 years of experience in the design and manufacture of memories

Most Econorams are available in 3 forms: unkit (sockets, bypass caps pre-soldered in place for easy assembly); assembled and tested; or qualified under the Certified System Component (CSC) high-reliability program (200 hour burn-in, 4 MHz operation over full temperature range, serial numbered, immediate replacement in event of failure within 1 year of invoice date).

OTHER MEMORY PRODUCTS AND SPECIALTY ITEMS

TRS-80 CONVERSION KIT \$109

Our kit is guaranteed for 1 year, includes DIP shunts, and uses 240 ns chips for operation at 4 MHz. Upgrades 4K TRS-80 to 16K or populates Memory Expansion Module; our novice level instructions make it easy. Also expands memory in Apple and Exidy Sorcerer computers. 3 kits/\$320.

MEMORY CHIP SPECIALS !!

2102L-1 (low power, better than 450 ns) 1K static RAMs now only 99¢ while they last. Only good on orders of 10 or more.

TMS4044 4K static RAMs, 450 ns, prime parts — \$7.95 each, 8 or more \$6.95 each, 32 or more \$5.95 each, 64 or more \$4.95 each. While they last.

HEATH H8 BARE BOARD MEMORY SPECIAL \$35

Don't need the full 12K of our standard H8 memory? We now offer the board, mounting bracket, edge connector, and print for only \$35. Populate it with a few support chips and readily available, low cost 2102s to build your memory up to a full 12K whenever your budget permits.

ACTIVE TERMINATOR KIT \$29.50

Our much imitated design plugs into any S-100 motherboard slot to treat the S-100 buss as the RF system it really is, thereby reducing noise, glitches, ringing, overshoot, and other buss-related problems. Improves reliability, saves power compared to passive termination.

PET TO S-100 INTERFACE BOARD \$199.95

From HUH Electronics (designed by Mark Garetz). Mates S-100 boards to the Commodore PET, or serves as nucleus of stand-alone 6500 series system.

11 SLOT S-100 MOTHERBOARD UNKIT \$90

Includes 11 edge connectors soldered in place for simplified assembly, and active termination for reliable data transfer. Dimensions: 8.5" x 11".

18 SLOT S-100 MOTHERBOARD UNKIT \$124

Same as above, but 18 slots and edge connectors. Dimensions 8.5" x 16.7".

... AND HERE'S WHAT WE DO FOR AN ENCORE!

We've got some great new products up our sleeves. How about 16K and 24K bank select memories (perfect for the Alpha Microsystems machine)? Or a memory management board that retrofits S-100 machines (Altair, IMSA, etc.) so that they can address half-a-Megabyte of memory? Then there's our super S-100 I/O board, with two hardware UARTs (no software UARTs that tie up your buss), full RS-232 specs, handshaking, and true S-100 compatibility... well worth waiting for. Watch this space for details in the months ahead.

Designing a Robot from Nature

Part 2: Constructing the Eye

Andrew Filo
4621 Granger Rd
Akron OH 44313

1(a)

Photo 1: The author's NELOC (neural logic cyberanlimate). The manipulator arm (with five degrees of freedom) and the 8008 computer (at upper right) are shown. The object resembling a TV camera is actually a sustained contrast detector used to obtain a rough image of the object to be grasped (see photos 4a and 4b and figure 7). Just below and to the right of the sustained contrast detector is a small box called the net convexity detector (see photo 5), which detects the direction of motion of an LED mounted on the hand of the manipulator and feeds this information into the homebrew computer. Photos 1(b), 1(c), and 1(d) show the arm in action.

The first piece of hardware to be built in my system was the manipulator. From the start it was obvious that a tongue-manipulator concept would be impractical; I chose remote operator control over the manipulator arm because I wanted to program manipulator motion by "teaching," and also to assist the system during its operation if necessary.

The manipulator I designed was roughly modeled after a human arm, with regard to its actions and dimensions. The manipulator is capable of five degrees of freedom, making it suitable for control by the motion of joints in a remote operator's arm. The prototype arm was originally designed to be pneumatically operated, but electric motors were substituted for convenience during testing. The motors (which accurately simulate the actions of pneumatic pistons and their servo valves) are electro-optically controlled. To start a motor or open a valve, the optocoupler connecting the motor or valve to the circuit's ground must be activated. Next, the forward or reverse coupler must be illuminated, connecting the motor or valve to a positive or negative voltage source, thereby causing the motor or air piston to extend or retract its portion of the manipulator. The only feedback devices located on the arm are two microswitches located just before the limit of travel of each joint. These microswitches provide either a full extension or full retraction signal for each joint. There is also a set of tactile sensor switches located in the fingertips of the device. Even though this manipulator may appear to have little in common with the frog, almost every facet of its design has been mentioned, in one form or another, in the previous (see February 1979 BYTE, page 12) analysis. The optoisolators, for instance, resemble the neuromuscular junctions in function, being the point where control signals leave the processing system and enter the motive system. The switches in the joints approximate the neuromuscular spindles. The tactile switches resemble the innervated capsules in the skin. And the entire manipulator itself is a folding, prehensile device, as is the frog's tongue.

Net Convexity Detector

Other structures developed for the turret system more closely resemble their biological counterparts. To monitor the motion of the manipulator more closely, my system requires a device that can track the motion of the arm. A matrix of net convexity detectors proved more than adequate for the task. By monitoring a small bright spot of light either reflected from a retroreflector or emitted from a brilliant LED (light emitting diode) source located on the manipulator, the net convexity detectors can easily monitor the motion of the manipulator. The net convexity detectors built for the turret system utilize the concepts of receptor geometry, weighting (for processing), and output suppression for size discrimination.

Building a small matrix of net convexity detectors could involve the use of possibly hundreds of sensors and many processing devices, but since I was not concerned with building an accurate model of the net convexity detector in the frog's retina, I could trade off various design features. For example, I deduced that 20 is the minimum number of receptors required to define motion on at least four axes. The geometry of these receptors has to be in a matrix of four columns by five rows with the high sensitivity receptor occurring in the fifth row, third column (see figure 6 and boxed text at end of article). In the frog, a net convexity detector may have up to 100 receptors in its receptor field, allowing the frog to precisely monitor the angle of the insect's trajectory, but to duplicate this would require the use of a monolithic digital sensor of photodiodes if the system were to be portable. Even a 4 by 5 matrix would require a 1 inch square surface to contain all of the detectors. This means that four net convexity detectors would require a 2 by 2 inch imaging surface — impractical both in terms of size and optics. Another serious problem was scanning and processing the information from the photoelectric devices.

Sources of Parts

A few items mentioned are available only from single sources:

National Semiconductor 650 calculator modules are available from Poly Packs, POB 942, South Lynnfield MA 01940.

The best sheet plastic and cement I have found for hobby use can be purchased from Plastruct Inc, 61 Monterey Pass Rd, Monterey Park CA 91754.

Photo 3: Elbow of the manipulator.

Introducing the Monday Machine.

For under \$10,000 we give you Sol,SM the small computer system for electronic typing and general purpose data processing, to brighten your Monday and speed the workload all the way through Friday.

Are you looking for a way to handle your typing load faster and far more efficiently? Are you looking for an easy to use electronic typing system that you or your secretary can learn in a matter of hours? And are you looking for a general purpose data processing system capable of doing other tasks around the office such as mailing lists, general ledger, accounts payable/receivable and payroll?

Then you're looking for the Sol "Monday Machine."

It's simply the best small computer system!

You can store, edit and print out text as long as 110 pages. You get 750,000 bytes of memory on diskette. Plus a letter quality SolPrinter that runs at

480 w.p.m. And a video monitor.

For the past few months, we've been selling our Sol Systems to selected businesses prior to formal introduction. One of our customers, a legal firm, uses their Sol System to type wills and contracts. Precedents and standard paragraphs are stored on diskettes for easy access.

The staff of this law firm was trained to use the Sol System on a Saturday. By the next Friday, no one could figure out how the workload was handled without it. The secretarial staff told us our keyboard has a nicer feel than that of the well-known maker of typewriters and computers. When they aren't using the Sol System for word processing, they do the legal accounting and update the work-in-progress report.

Processor Technology knows computers and knows programs.

In the past two years, more than 10,000 Sol computers have been installed.

We're easily one of the most successful pioneers in the small computer field because our systems are sophisticated yet easy to use.

The figure numbering sequence for this article has been continued from part 1 (February 1979 BYTE, page 12).

Figure 7: Details of the sustained contrast detector. At (a) is a cross section of the unit, which resembles a television camera; (b) is a simplified block diagram of the system. The sustained contrast detector is used to obtain a rough image of the object to be grasped by the manipulator.

4(a)

4(b)

Photo 4: Interior of the sustained contrast detector. Shown at (a) is the lens (at left), the array of phototransistors (at right), and the associated electronics. 4b shows the 4 by 5 prototype array (compare with final version in figure 7).

Text continued from page 115

I solved both problems by using a simple 6 digit, 4 function calculator integrated circuit, the National Semiconductor MM 50736. Before I began work on the neural logic cyberanimate, I had experimented with this device and found it to be compatible with photo-darlington transistors 2N5777 thru 2N5780. With the photo-darlington transistors as input devices, the calculator circuit could register pulsations of light from a diffused LED source more than two feet away. Clearly this device was capable of detecting bright objects at short distances. Additionally, it was possible to use the data processing nature of the calculator circuit to assign different values to the receptors and, based on these values, produce two distinct output signals. The weighted inputs were made simply by attaching one photo-darlington amplifier to the calculator circuit where the 1 switch of the keyboard would normally be connected, and a second photo-darlington to what would normally be the 0 position.

The two types of output signals are the results of the data which the photo-darlingtons receive. Note that there are only two photo-darlingtons connected to the calculator circuit in figure 6, yet I had previously stated that the minimum configuration for the net convexity detector was a matrix of 20. This is because I used fiber optic pipe for "receptors" and the photo-darlington devices as detectors. Figure 6b shows the arrangement of the optical fibers. 19 fibers have a value of 1 (they are equivalent to the low sensitivity receptors). All 19 of these fibers are fused to the photo-darlington that has a numerical value of 1. The remaining fiber is fused to the 0 value photo-darlington (to simulate the high sensitivity receptor). The completed device can detect and record the trajectory of a small moving penlight flashlight at a distance of 4 feet (well beyond the extended length of the manipulator); obviously, if the object's path does not cross the high sensitivity path, the data is invalid.

Sustained Contrast Detector

Another structure derived from my analysis is a sustained contract detector (figure 7). This device is a spinoff of a previous electro-optic project. But without the analysis of the frog's eye I would never have considered this application. The sensor consists of a matrix of five rows by five columns of photo-darlington transistors (see photo 4). The columns of the sensor

are scanned by TTL (transistor-transistor logic) devices controlled by the computer. The 5 row output is fed into a programmable read only memory that serves two functions. First, the logic voltage level on the address lines of the programmable read only memory sets the on/off contrast levels for the sensors, thus eliminating the gray scale conversion problem. Second, the programmable read only memory is encoded with a truth table that can vertically reduce

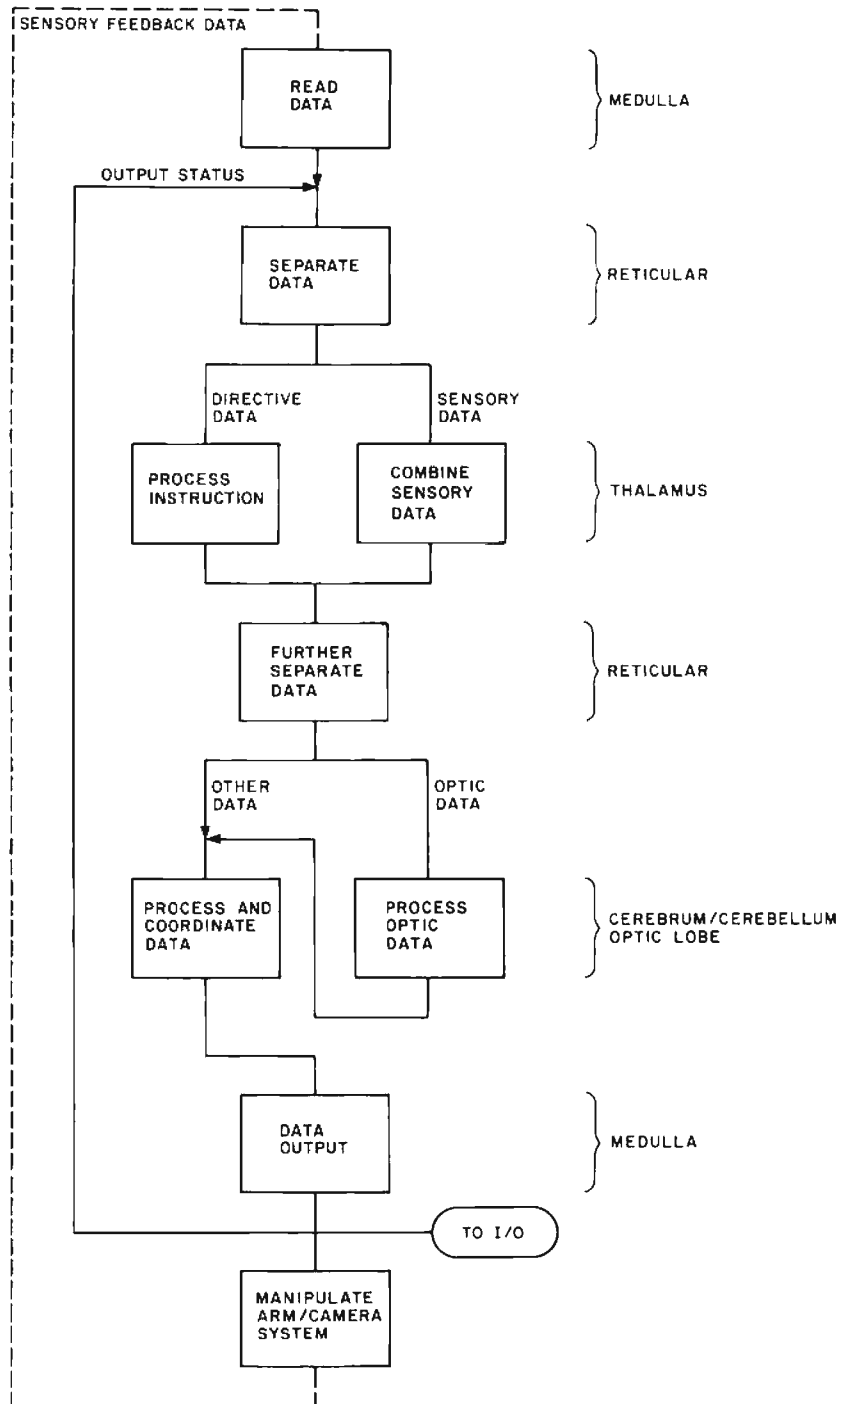

Figure 8: Simplified system flowchart, showing parallel functions in the brain.

Photo 5: The net convexity detector, shown with the National Semiconductor NS 650 calculator module (connecting wires not fully visible). The calculator module used in the final version is an MM 50736, which has no readout. The NS 650 is useful for readers who will not be interfacing the unit to a computer immediately, since it does have a readout.

a high contrast image line by line with the computer's assistance. The image reduction process will horizontally outline an image and vertically dimension it (see figure 7 and photos 4a and 4b), enabling the computer to gauge the dimensions of objects within reach of the manipulator.

Finally, there was the design of the processing system. By designing all of the most external appliances first, I hoped to further define some of the required characteristics of the neural logic cyberanimate. The purpose of my processing system (including the computer program, preprocessing, and post-processing elements) as stated before, is to locate, classify, and manipulate objects specified by control instructions. To accomplish this, the system first has to be able to recognize the command instructions that specify the location of the object to be manipulated and what is to be done with it. Next, the system has to use measurements of pressure and reflected light from the environment made by the sensory instruments. Once in the processing system, this information has to be recognized and labeled. Incorrect or unnecessary measurements will then be eliminated. The filtered measurements will then be combined according to their information content (ie: optical and mechanical data relating to the position of the manipulator would be combined, etc). The combined data, whether optical, optical-mechanical, or mechanical, is then processed according to its type. Optical data is reduced to information pertaining to object size and location. Optical and mechanical information processing describes the location and position of the manipulator. Processed mechanical information relates manipulator position and contact with an object. Based on the results of this processing, the system then has to grasp and move the object as specified by the com-

mand instructions. Following this, the system notifies the command system.

The processing system uses an 8008 processor (not the best choice, but one which was chosen for expediency since I already owned one) interfaced to a series of 8223 programmable read only memories used to decode gray scale images, fire the LEDs in the optocouplers, and perform the various other tasks in the system.

The algorithm for the NELOC system is diagramed in figure 8. Notice in the algorithm that sections of the program perform functions similar to those discussed in the cyberanimetric analysis of the brain. For example, monitoring, filtration, and suppression of sensory data, which are reticular functions, are performed in the program. Also in the algorithm are routines that combine sensory data, process and coordinate it, and control the input and output of data-functions that simulate those of the frog's brain. Another routine placed in the algorithm accepts instructions from the I/O and converts them into a form that can be used by the rest of the program. This routine makes it possible to control the system by external command.

During its trial operation, the neural logic cyberanimate performed quite well. With electric motors driving the manipulator arm, it took the system about 60 seconds to find and manipulate a test object. The most impressive feature of the system's operation is its ability to resolve the position of the manipulator and the test object.

Conclusion

During the design and construction of the NELOC system I encountered no major design problems because, from the start, it was possible to determine what portions of the system would be difficult to design or construct, and, therefore, I could budget my time and money accordingly. The benefits of clearly defining the organization of the system before designing the hardware are obvious. I put about 120 hours into the research, design, and construction of the prototype neural logic cyberanimate. If I had tried to develop these structures without the cyberanimetric philosophy, it would probably have taken much longer to design a net convexity detector or a reticular system.

Of course the NELOC system itself represents the equivalent of only a very thin neurological slice through a simple organism. By no measure is the neural logic cyberanimate intelligent, but I believe this design philosophy could be useful for designing systems beyond the simple servo system.

Remember our name if your memory goes blank

Sooner or later, you might have to replace a defective memory board in your system.

And if your present boards are built to "hobby" specifications, it'll probably be sooner.

That's when to remember our name — **INDUSTRIAL MICRO SYSTEMS, INC.** Every board we produce is built to industrial specs throughout; we don't stop at gold-plated contacts.

Remember our name when you're ready to expand your memory capacity, too. Our 16K and 32K boards feature Memory Management and Memory Mapping, respectively, which let you grow beyond the 64K limit.

We make six different static RAM memory boards for the S-100 bus, including 250 nanosecond

and 450 nanosecond versions of 8K, 16K and 32K sizes.

Although we've sold thousands, our name is unknown. That's because other quality-minded manufacturers and systems houses bury us in their products.

Now, however, you can select Industrial Micro Systems brand memory boards at retail computer stores everywhere. And get memorable quality at unforgettable prices.

For full details call your nearest dealer today. Industrial Micro Systems, 628 N. Eckhoff, Orange, CA 92668. (714) 633-0355.

Dealer inquiries answered promptly.

INDUSTRIAL MICRO SYSTEMS, INC

The great unknown.

Figure 9: Construction details of the net convexity detector.

Building the Net Convexity Detector

The net convexity detector used in my system is a good example of how a calculator circuit can be used for noncalculator application. As illustrated in figure 9, the net convexity detector is a very simple device. The whole idea behind the circuit's operation is that the sensory head can, in effect, push the right keys on the calculator in response to the motion of an image that is a certain size and brightness. As explained previously, the purpose of the net convexity detector is primarily to define angle and direction of a small bright object. In this design, a mask is used as a template to gauge the diameter of an image. If a bright, moving image is small enough to illuminate only one hole of the template at a time, the calculator will register its movement as a series of numbers. If the image is too large, and illuminates more than one hole at a time, the calculator will display only one number that, in terms of a trajectory, would mean nothing.

To build the net convexity detector it is first necessary to build the sensor head. Figure 9b is an exploded view of the sensor. In the construction of the sensor it is necessary to use a lens that forms a focal point at a distance no shorter than 25 mm. Next a case is constructed from sheet plastic. This case should be at least twice as long as the focal point of the lens and must be able to hold a mask containing a 4 by 5 matrix of holes. The simplest way to make the mask is to use a piece of unclad perforated circuit board with holes 2.5 mm on center. Just cut a corner of the board off so the piece will have four by five holes. The mask must then be secured in the case so it will be at the lens's focal point. The inside of the forward end of the case must now be painted flat black. Two end pieces are cut, one is drilled to accommodate the lens and is glued to the front of the case. Next, a 4 lead cable is brought through a hole drilled in the end of the case. A short piece of plastic tube is glued over this hole and filled with epoxy to block light. Two photo-darlington are

attached to this cable. Notice in figure 9 how a length of brass tube is aligned with one of the photo-darlingtons. This tube must be located in the second column of the first row for the sensor to work properly. This tube carries the image to the 0 value darlington only. The tube must be carefully glued to the mask and the darlington by a very small amount of epoxy glue. The photo-darlington and epoxy joint are then painted black. Before attaching the back of the case, make sure that the 1 value photo-darlington is in the center of the case.

After the sensor has been completed, it is a simple matter to complete the circuit. A National Semiconductor calculator module, the NS 650, has all of the solid state electronics for a calculator, including a 6 digit display. By adding a battery, switch, and the sensor head (see figure 10), the circuit is finished.

To test the circuit, use a small penlite type flashlight, moving it in board circles at a distance of 3 feet away from the sensor. Many 1s and a few 0s should fill the display until the calculator indicates an overflow. If you move the light source on a straight vector that crosses the hole to the isolated

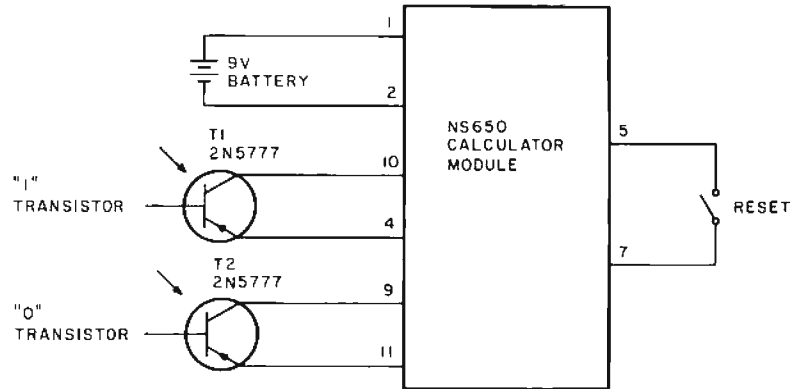

Figure 10: Circuit for the net convexity detector (pins numbered left to right as in the orientation in photo 5).

darlington you will get a certain readout. Figure 6b shows all of the possible fields of vectors, the direction that the object must be traveling, and the output that should be displayed by the calculator. All other combinations are illegal.

Although the net convexity detector is a very simple device, it must be built very precisely. All surfaces should be flush, parallel, or perpendicular. Optics should be carefully aligned and all seams should be checked for light leaks. ■

BIBLIOGRAPHY

Listed are 15 books, some containing information about amphibians, others concerning robot and artificial intelligence systems built by cognitionists and neural cybernetists. The books range from elementary to very complex.

Some of the data about the biological frog was obtained from the following sources:

Chiasson, R, *Laboratory Analysis of the Necturus*, Iowa, William C Brown Co, 1971.

Keeton, W T, *Biological Sciences*, New York, W W Norton and Co Inc, 1972.

Tansley, K, *Vision in Vertebrates*, London, Chapman and Hall Ltd, 1968.

The following are some simple introductory books on robots:

Calder, N, *Robots*, Roy, 1958.

Gennings, G, *March of the Robots*, New York, Dial Press, 1962.

Wells, R, *Bionics: Nature's Way for Man's Machines*, New York, Dodd, Mead, and Co, 1969.

Books at a more advanced level:

Cote, A J, *The Search for Robots*, New York, Basic Books Inc, 1967. (Neural cybernetics approach.)

Feigenbaum, E A (editor), et al, *Computers and Thought*, New York, McGraw-Hill Book Co Inc, 1958. (Cognition approach.)

Nilsson, N J, *Learning Machines*, New York, McGraw-Hill Book Co, 1965. (Perceptrons).

Wiener, N, *Cybernetics*, New York, The MIT Press and John Wiley and Sons Inc, 1955.

Some of the more technical books available are:

Our MacroFloppy™ goes twice the distance. For \$695.

Circle 220 on inquiry card.

Introducing the Micropolis MacroFloppy™ 1041 and 1042 disk drive sub-systems. For the S-100/8080/Z-80 bus. Packing 100% more capacity into a 5¼-inch floppy disk than anyone else. 143K bytes, to be exact. For as little as \$695

The MacroFloppy 1041 comes with the Micropolis Mod I floppy packaged inside a protective enclosure (without power supply). And includes an S-100 controller, interconnect cable, Micropolis BASIC User's Manual. A diskette containing Micropolis BASIC, and a compatible DOS with assembler and editor. The 1041 is even designed to be used either on your desk top, or to be integrated right into your S-100 chassis.

The MacroFloppy 1042 comes with everything the 1041 has, and more. Such as d.c. regulators, its own line voltage power supply, and, to top it off, a striking cover. Making it look right at home just about anywhere.

Both MacroFloppy systems are fully assembled, tested, burned-in, and tested again. For zero start-up pain, and long term reliability. They're also backed up by our famous Micropolis factory warranty.

And both systems are priced just right. \$695 for the MacroFloppy 1041 and \$795 for the MacroFloppy 1042.

You really couldn't ask for anything more.

At Micropolis, we have more bytes in store for you.

For a descriptive brochure, in the U.S. call or write Micropolis Corporation, 7959 Deering Avenue, Canoga Park, California 91304. Phone (213) 703-1121.

Or better yet, see your local dealer.

MICROPOLIS™
More bytes in store for you.

Continued from page 13

along the entire back panel as well as the lower back corner of the mother board (5 VDC voltage regulators are on each circuit board). With two exceptions, everything went together easily, and exactly as presented in the assembly manual.

The first problem occurred when I attempted to install the self-retaining nuts in the side panels. For one thing, it can be very difficult to press these nuts into the very sturdy composition board unless they are gently tapped with a hammer. In addition, the part numbers for one of the nuts on the left side panel as illustrated in the assembly manual didn't correspond to the associated detail pictorial in the illustration booklet.

The only other problem I encountered during this stage of assembly was the installation of the side panels. Access to the side panel self-retaining nuts at the bottom rear corner of the chassis was obstructed by the previously installed screws and nuts that hold the rubber feet to the bottom of the chassis. My solution was to turn the chassis onto the side panel to be attached and insert and tighten the remaining screws to the appropriate panel.

The Mother Board

The mother board consists of two sections: a portion of the power supply, and ten rows of paired 25 pin plugs used later for connecting circuit boards and cables to the system bus. The installation of the plugs can be tedious. If you have not had much soldering experience, practice before you begin this board.

The most challenging part of the mother board assembly process is soldering some 500 pins which form the connectors for the individual boards of the system. The remainder of the board consists of a few capacitors, resistors, and diodes. There are, however, two instructions whose sequence should probably be reversed. Specifically, you are instructed to solder two electrolytic capacitors to the board and then secure each to the board with a self-locking cable tie. Reversing this sequence insures that no strain will be placed upon the soldered capacitor leads by the cable ties when they are tightened. The finished board is installed on the righthand side panel of the chassis after the twisted pair of 18 V leads from the power supply transformer are connected to the board. I had no trouble obtaining the proper resistance and power supply

MetaFloppy™ goes beyond.

The Micropolis MetaFloppy™ gives you more than four times the capacity of anyone else's 5¼-inch floppy. Because it uses 77 tracks instead of the usual 35.

The field-proven MetaFloppy, with thousands of units delivered, comes in a complete family of models. And, like our MacroFloppy™ family of disk drives, MetaFloppy is designed for the S-100/8080/Z-80 bus.

For maximum capacity, choose our new MetaFloppy-1054 system. Which actually provides you with more than a million bytes of reliable on-line storage. For less money than you'd believe possible.

The MetaFloppy-1054 comes complete with four drives in dual configuration. A controller. Power supply. Chassis. Enclosure. All cabling. A new BASIC software package. And a DOS with assembler and editor. There's even a built-in Autoload ROM to eliminate tiresome button pushing.

If that's more storage than you need right now, try our MetaFloppy-1053, with 630,000 bytes on-line. Or our MetaFloppy-1043, with 315,000 bytes on-line. Either way, you can expand to over a million bytes on-line in easy stages, when you need to. Or want to.

In other words, if your application keeps growing, we've got you covered. With MetaFloppy.

The system that goes beyond the floppy.

test readings outlined in the manual, and proceeded to the next step of assembly.

Front Panel Circuit Board

The H8 front panel control system has many features which make using the H8 a pleasure. One of these is the multifunction console keypad that provides users with direct, easy-to-use commands to operate the H8 without a terminal (see figure 1). Another feature is the 7 segment LED (light emitting diode) display system that displays a variety of system status information in an easy to read format not found on many larger 8 bit systems. We'll take a closer look at this unique system later, but first let's consider its assembly.

The entire assembly procedure is very straightforward. However, it is during the assembly of this board that a second rather tedious subassembly construction activity is encountered. In particular, it is necessary to prepare the cables that run from the board to the first row of plugs on the mother board and between the front panel and processor boards. The instructions and illustrations for this stage of construction are excellent and, if they are followed exactly, you should have no problems. The

work performed on the cables is rather delicate, requiring the same amount of care and patience needed while assembling the mother board. One construction hint: you are instructed to mount four single element LEDs on the upper left side of the board. Make sure that each LED is mounted at exactly the same height as the others (0.25 inches from the board to the base of each LED). This can be easily accomplished by cutting a piece of 0.25 inch wire and using this as a spacer placed underneath each LED between the pairs of LED leads prior to soldering each to the board.

The Processor Board

Another feature of the H8 is the processor board, which comes preassembled. This is a real advantage because many of the problems that computer kit builders encounter are caused by mistakes made during assembly or installation of the processor board (see photo 2).

With assembly of the circuit boards and chassis complete, all that remains is to install the components. Of course, the H8 does not come with other boards that are necessary to have a functioning computer, such as extra memory and an

I/O (input/output) board. These are options the user purchases when buying an H8 (and most other computers, for that matter).

The Memory Board

If you want to use your H8 without external devices, the H8-1 memory board is the only other board you will need. The H8-1 is a 4 K byte programmable memory board which can be extended to a full 8 K by installing the optional H8-3 memory chip set. This board is easy to assemble, and not much more need be said about it — nothing, that is, except a short story about a mistake I made which also points to another nice feature of the H8.

Briefly, it happened like this: I was assembling the H8's circuit boards with extreme care, paying particular attention to the quality of the instructions and illustrations and making notes in my manuals I might want to use later. On the evening I started putting the memory board together, friends dropped over, and because the board looked so simple to put together, I decided to put part of it together while we relaxed and chatted. As a result of my divided attention, I installed a 14 pin IC socket in a 16 pin socket location.

One of my visitors was just beginning to get interested in computers (which was part of my reason for doing some of the assembly while company was around) and I showed her the partially completed board. She looked at it, asked a few questions, and then said, "What are those holes for by the end of that socket?"

I turned a bit red — I had blundered in the middle of a demonstration. Well, for the next 45 minutes we struggled to remove the socket, clean out the solder that was plugging the holes in the board and refit another socket. The H8 as well as its accessory kits come with sockets for all of the ICs including the 7 segment displays. If you ever need to replace an IC, you won't have to struggle with unsoldering it and cleaning off the board. And you won't have to pay extra for the socket sets when you buy the kits. The finished board is shown in photo 2.

The H8-5 SIO Board

If you want to connect your H8 to a console terminal or use the system software stored on cassette tape, you'll also want the H8-5 serial I/O and cassette interface board. It took quite a while to assemble because of its relatively high component density, but it presented no construction problems.

Testing and Alignment

After assembling the basic H8 system, you are instructed to perform three program-able test routines as well as an alignment of the cassette interface. The first test routine is a short program entered in machine code through the front panel keypad. The routine performs a general check of the H8 and at its end-of-run displays several messages on the front panel LEDs (ie: YOUR H8 . . . IS UP AND . . . RUNNING). If the test routine does not execute properly, the reader is directed to an extensive troubleshooting flowchart that is ten pages in length and very clearly written. I had no trouble at this point and proceeded to the next test routine.

The second of the two routines is a memory test routine. It is also entered in machine code through the front panel keypad. The program performs a thorough test of every memory location on any 4 K or 8 K byte memory board by storing and retrieving consecutive octal values from 000 through 377 in every memory location. If an incorrect value is detected during a compare operation, the program halts, sounds an audio alert, and displays the expected (rather than observed) contents of the location where the test failed. The address where the test fails and the actual (or observed) contents of memory at that location can both be displayed on the LEDs by displaying the contents of the HL register pair and the accumulator, respectively. If no problems are encountered during execution of this routine, it will continue to repeat the test cycle until stopped by the user. Everything worked fine for me as I watched the memory content values go sailing by in the display.

The last task to be performed is the alignment of the cassette interface on the cassette I/O board. The procedure consists of setting the two variable resistors on the board to the correct positions as indicated by the readout on an on board single element LED test lamp. This LED also comes in handy later for troubleshooting the H8's circuitry. The adjustments were quite tricky to make, but after two tries and a number of test loads of software cassette tapes, it worked very well. Had it not worked, I could have referred to another troubleshooting flowchart to locate the problems.

But everything did work. I proceeded to play around with the keypad commands, becoming familiar with what made my H8 "tick." Finally it was time to install the front panel cover and the louvered metal chassis cover. I connected the serial I/O

Up Your Output.

TEMPOS

MULTI-TASKING!

The TEMPOS Operating System is quickly becoming the standard in Multi-User, Multi-Tasking operating systems for 8080 and Z80 microcomputers. Multi-Tasking means that, even with only one user at one terminal, more than one job can be running on the system *simultaneously!* If you have ever had to go get a cup of coffee while you wait for your computer to print listings, you *know* the advantages of a system that will handle one job while you are working on another. TEMPOS is a true time sharing system, and the maximum number of jobs is limited only by your memory.

MULTI-USER!

Want to share your computer with another user? With TEMPOS all it takes is another terminal. . . up to seven interactive terminals are allowed! And with Re-Entrant programs, each user does not need a complete copy in memory. We include three Re-Entrant programs (the OPUS: THREE High-Level Language, the TEXTED Text Editor, and FILES, a disc file directory/manipulator) or write your own! In addition, we include an assembler, a linking loader, over a half-dozen other utility programs and over 60 system subroutines, callable by the programmer!

PROVEN!

With TEMPOS, you get a package that has been tested in our facilities for over two years, and in the field at over 50 different installations. We have used this system ourselves for everything from writing high-level languages to developing applications to text editing to games. TEMPOS is undoubtedly the most flexible software tool on the market. . . and you can have it for much less than you think!

COMPATIBLE!

TEMPOS is available for many different systems; pre-written drivers may include yours. Or, using our interactive System Generation Routine, you can add your own. Call or write *now* for our free catalog and the name of a dealer near you. The TEMPOS Operating System is available for \$787.00, the manual set (price may be credited toward the purchase of the TEMPOS package) for \$21.50 (prices include shipping within the U.S.).

TRS-80 Software Exchange

cable to my H9 video terminal and was ready to do the final test routine for the serial I/O channel on the serial I/O board. It consists of setting up the USART (universal synchronous/asynchronous receive/transmit device) assigned to this channel and transmitting and receiving characters to and from the terminal. I was amazed at how easy it was to do I/O routines from the front panel. The final test was completed, so I left my system for awhile to return to the H8 operating manual and software manual set.

The Benton Harbor Bus

The Benton Harbor Bus represents a departure from the S-100 bus, which has become one of the "standards" of the microcomputer industry. The H8 system bus uses only 50 lines, compared with the 100 lines of the S-100. Since the S-100 was designed early in the history of the microcomputer industry, it incorporates bus lines which are no longer needed or which have been replaced by more recent system control hardware.

Manufacturing costs are kept down by not having to machine an edge connector tongue, not using gold plated edge connectors, and replacing the expensive 100 pin socketing system of the S-100 with much less expensive plug and socket sets which are assembled by the user.

Another feature found on the H8 is its convection cooling system. This system has been designed so that power supply voltage decreases slightly every time a circuit board is added to the mainframe. As more boards are added, the proportional amount of heat dissipation from each circuit board regulator also decreases. It is for this reason that you are instructed to "locate circuit boards in alternating positions for improving ventilation." When the time comes to add boards to the unoccupied alternating rows of plugs on the mother board, the effective heat dissipation will be low enough to position boards adjacent to one another. To improve upon this scheme, all circuit boards are installed on a slant to facilitate the convection cooling process. The end result is a quiet running machine which does not require the added cost of a fan to keep component temperatures down.

Costs are also kept down by the size of the H8's power supply. I saved a lot of money by not buying an 8 bit machine with a large power supply. The fact is that you pay dearly for every extra and often unused ampere that a power supply delivers. In this regard, the H8 delivers a full 10A,

which is sufficient to operate all of the boards that the chassis can hold — up to seven in addition to the front panel and processor boards. It is also switch-selectable for operation on either 110 or 220 VAC, an advantage for European users. It also includes a switch for normal or low level line voltages, which may come in handy in case of a brownout — you'll need a separate generator for a blackout.

Split-Octal Notation

Before going on to discuss the firmware that coordinates many H8 operations, we should first describe the type of machine language code notation used by the H8. The H8 uses a number system called split octal, a modification of straight octal that is well suited to 8 bit computers like the H8. It is also well suited for the H8 display system, as you will see.

Split-octal notation is identical to octal notation except that the two most significant bits of each pair of data bytes are represented by one arabic numeral. In this scheme 377 is the highest value that can be represented by one 8 bit byte (ie: word) of data. Thus:

$$377 = \underbrace{11}_3 \underbrace{111}_7 \underbrace{111}_7$$

And, the highest value that can be represented by two 8 bit bytes of data would be 377.377. The H8 defines 1 K bytes of memory as 003.377 bytes and 8 K bytes of memory as 037.377 bytes. The H8 is designed to reserve certain portions of memory for the system monitor and later system expansion as shown in the H8 memory map (see figure 2).

PAM-8, the Front Panel Monitor

The functions and features discussed above are tied together by another H8 feature — the front panel monitor — which resides in 1 K bytes of read only memory on the processor board. It also controls such activities as initializing the system during power-up, coordinating tape loads and dumps, communication with the Console Driver routine (part of every Heathkit software package), processing restart and clock interrupt vectors, and processing user defined interrupt requests.

H8 Software

Someone once said a computer system is no better than the software that comes with

it. This is as true for large computers as it is for microcomputers. The H8 software packages are intended to function as an integrated system. They include TED-8, a line oriented text editor; HASL-8, a machine language assembler; BUG-8, a machine language debugger; and Benton Harbor BASIC, Heathkit's version of the popular interactive programming language created many years ago at Dartmouth College. Let's see what they're all about.

Common Elements

Each of these software packages contains a console driver routine that enables the H8 to communicate with a user's console terminal (Teletype, video display terminal, etc) and a cassette or paper tape transport. It occupies 355 decimal bytes of programmable memory in each software product from locations 040.100 through 041.144. Thus, all of the console driver routines are available to users for special purpose modifications as well as for use in user designed software which would benefit from using the same I/O routines, including I/O port assignment. It is responsible for processing console terminal interrupts, setting up and reading USART (universal synchronous-asynchronous receiver-transmitter) modes, commands and statuses, processing control characters (such as CTL-C, CTL-Q, and CTL-S), reading and writing single characters, and processing character strings in the 28 character type-ahead buffer. During interrupt processing, the console driver interacts with the PAM-8 system monitor. The entire listing of the console driver routine in assembly language is provided in an appendix to the software manuals. As in the case for the monitor, the console driver routine and all

other software for the H8 were developed for Heath by Wintek. The Heath Company cannot (under contract with Wintek) provide any listings other than the partial listings presented in the software manuals, and "cannot provide consultation on user developed programs or modified versions of Heath software products." However, with a homebrew disassembler or memory dump routine and the partial listings provided, you might not have too much difficulty in generating your own unofficial versions of the source codes.

Another common element to all Heath software products is the software configuration procedure that must be performed before any software distribution tape is loaded into the H8. The procedure provides opportunities for the user to adapt each software package to his or her own needs. A list of program configuration parameters is presented to the user, who can then define items such as BKSP, which allows the user to define which key will be used to control the backspace function, HIGH MEMORY, which allows the user to specify that section of high memory that he or she does not want used by the system program, and LOWER CASE, which allows the user to select either upper and lower case or upper case only I/O to the terminal.

A third element common to all Heath software products is command completion. The feature allows the user to enter the first letter(s) of a program command, whereupon the software routine, in conjunction with the console driver, will print out the remainder of the command. For example, a text editor allows the PRINT command to be evoked by typing P, and the system responds with RINT, completing the command. The problem is that, if one is a fast

DUAL DRIVE MINIFLOPPY FOR PET!

A FULL RANGE
OF PERIPHERALS
TO COMPLETELY
SUPPORT YOUR PET

PROFESSIONAL
SOFTWARE
SUPPORT

A TOTALLY
INTEGRATED
PET* SYSTEM

DOMESTIC & OVERSEAS DEALER INQUIRIES INVITED ON DISK SYSTEM & MEMORY

NOW THE DISKDRIVER DUAL DRIVE DISK SYSTEM CAN ADD TOTAL SYSTEM CAPABILITIES TO PET!

THE DISKDRIVER,
DOS, AND EXPANDAPET
ARE ALL PRODUCTS OF
COMPUTHINK

- * DUAL MINI FLOPPY DRIVE (5.5") WITH 100K PER DISK SIDE FOR TOTAL 200K ON LINE
- * EXPANDABLE IN MARCH/APRIL 1979 TO 400K ON LINE VIA DOUBLE DENSITY FORMAT
- * DISKMON-DISK OPERATING SYSTEM (DOS) IS RESIDENT IN PROM VIA DISK CONTROLLER BOARD THAT PLUGS DIRECTLY INTO THE INTERNAL EXPANDAPET MEMORY BOARD.*
- * DISKMON COMMANDS EXIST SIMULTANEOUSLY WITH THE BASIC LANGUAGE COMMANDS.
- * DISKMON ADDS 16 COMMANDS TO BASIC INCLUDING DISK DATA FILE COMMANDS.
- * DESIGNED FOR COMMERCIAL SPEED REQUIREMENTS — READS AN ENTIRE TRACK AT A TIME.
- * DISK DRIVES ARE AUTOMATICALLY TURNED OFF BETWEEN COMMANDS FOR LESS WEAR
- * EXCELLENT DOCUMENTATION AND FULL SOFTWARE SUPPORT VIA FUTURE SOFTWARE
- * DISKMON AUTOMATICALLY SUPPORTS COMMERCIAL TYPE PRINTER (CENTRONICS MODELS) VIA PARALLEL PORT
- * DISKDRIVER COMES COMPLETE WITH ATTRACTIVE BEIGE CABINET, BUILT IN POWER SUPPLY, DISK CONTROLLER BOARD, ALL PLUG COMPATIBLE WITH YOUR PET (DISKDRIVER REQUIRES THE EXPANDAPET)
- * NOW FOR THE FIRST TIME YOUR PET CAN BE UTILIZED AS A COMPLETE, TOTAL SYSTEM.
- * APPLICATION/DEVELOPMENT SOFTWARE AVAILABLE * BUSINESS PACKAGES IN MARCH/APRIL
- * FULL PRODUCT (HARDWARE & SOFTWARE) SUPPORT FROM COMPUTHINK AND DEALERS.

Circle 47 on inquiry card.

typist or has used computer terminals before, one tends to enter too many beginning characters and thereby cause an error. For example, I still haven't gotten used to typing just P to evoke the print command. So what happens? I type out the entire command, PRINT, and the result is PRINT RINT. The problem is even more bothersome because the command completion for some of the same commands is different for different software. Using the text editor (the above example), typing just P evokes the RINT completion; using BASIC, a PR evokes the INT completion.

TED-8, the Heath Text Editor

A text editor turns the user's terminal into a typewriter of sorts with the added capability to store what is typed into memory, and to edit the contents once stored. It is essential for writing assembly language programs and for preparing various kinds of texts, such as newsletters and reports, for personal use.

TED-8 is a line oriented text editor that occupies approximately 4.3 K of user memory. It has commands for loading and dumping both files and individual records, searching for character strings, clearing the text buffer, replacing and deleting lines, specifying range statements which control the number of lines upon which commands will operate, creating new text, and editing existing text in the buffer. It also includes a TAB command to facilitate the writing of assembly language programs, a wide variety of range commands, and a USE command that provides the user with a current number-of-lines count and memory usage information.

In my opinion, TED-8 is a reasonably good small system text editor with considerable flexibility. It is, however, somewhat inconvenient to use, especially when one needs to edit a particular line but does not know the exact line number and must therefore either count the lines (an inconvenience if there's a lot of text to cover) or write and execute an often lengthy expression to specify the character string in the line that is to be edited. Some of this could have been avoided if a line numbering system had been included, which could be stripped off at the end of editing.

Another problem is that the text editor and assembler are interdependent in some situations but must each be loaded separately into memory. This makes repeated editing and execution for program testing a real chore. I would have liked to see these programs (TED-8 and HASL-8) put together as one package, or have been provided with a dedicated linking loader as part of the

PAM-8 monitor that would enable me to load both programs into memory. Aside from these two disappointments, I am pleased with the general capabilities of TED-8. For the small amount of memory it occupies, it is relatively powerful.

HASL-8, the Heath Assembly Language

HASL-8 is a 2 pass assembler which effectively means that you must load (playback) your source program (created by TED-8) twice before the assembly of the source program can be executed. (You can see how often you may have to load and unload, rewind and playback cassette tapes if you are editing and testing even a moderately sized assembly language program.) The output of HASL-8 is object code which is the machine language for the computer. In addition, a source listing of your program is generated, which includes not only the text of your original program but also the addresses which correspond to specific assembly language and machine language instructions (op codes). The Heath assembly language resides in slightly less than 8 K bytes of user memory and supports a complete set of operators, tokens, and pseudo opcodes (assembler directives), including in the latter a large set of pseudo ops for error detection and control of listings.

When a configured version of HASL-8 is started, the user must first answer a series of questions regarding the desired page size, interpage gap size, listing port, whether or not to produce a binary image of the source program in memory, and whether or not to save a binary image on tape. The program then requests input of the source program from tape, makes a second pass after the tape is rewound, assembles the object program, and dumps out a listing at the console terminal. The listing includes single character error codes in the far lefthand margin, and run summary data at the end of the listing (number of statements listed, remaining free bytes in user memory, and the number of errors detected). HASL-8 does not process macros or provide a cross-reference listing of user labels and associated addresses, both of which would be a nice improvement in a subsequent version. It is a fairly average assembler for its size, but should be adequate for most general purpose assembly language programming. Its documentation is very good, as is the documentation for all of the software products from Heath.

BUG-8, the Heath Console Debugger

BUG-8 is one of the best software packages that comes with the H8. Residing in any

MICROPROCESSOR ENGINEERS

EW SOFTWARE ENGINEERS

When Opportunity Knocks... GRAB IT!

Sure, you're a proficient and talented microprocessing engineer or an EW software engineer, and things are going OK professionally, but deep down inside there's a gnawing that says something's missing. Not enough challenge, the same routine, mundane assignments, not much professional growth.

Here at AMECOM, a major Litton Systems division, we're working on major NEW Avionics ESM programs with production follow-on to provide systems operating capability through the year 2000 requiring state-of-the-art development of multifunction distributed microprocessors.

If you are a MICROPROCESSOR DESIGN/DEVELOPMENT ENGINEER or a REAL-TIME ELECTRONIC WARFARE SOFTWARE ENGINEER, we have positions of uncommon potential from Member of the Technical Staff to Senior Scientist with salaries to \$35,000.00.

Don't be bored any longer. Grab the initiative about opportunities with an international leader; call COLLECT or send your resume including salary history in confidence to:

W.L. McAMIS (301) 864-5600

Amecom is located in a pleasant Maryland suburb with your choice of city, country, mountain or waterfront living without onerous taxes.

Amecom Division

**LITTON
SYSTEMS, INC.**

An Equal Opportunity Employer M/F/H

Circle 7 on inquiry card.

3 K bytes of memory, it provides the user with powerful tools for writing, editing and debugging machine language programs from a console terminal in octal, decimal or ASCII format. It interacts with the PAM-8 monitor and uses many of the PAM-8 routines. With BUG-8 running as a full console monitor, you can do any of the following:

- examine the contents of any memory locations;
- change the contents of memory locations;
- examine the contents of any processor register;
- change the contents of any processor register;
- start program execution;
- perform single step execution of a program;
- set program breakpoints;
- clear program breakpoints;
- load and dump programs from OR to tape.

The command format used in BUG-8 is short, which makes using BUG-8 a real pleasure (the same kind of feature would be very desirable as a configuration option for TED-8).

Benton Harbor BASIC and Extended BASIC

When you purchase an H8 kit, you are supplied with Heath's 8 K byte, Benton Harbor BASIC. In addition, Heath has also marketed two versions of Extended BASIC (versions 10.01.02 and 10.02.01) which provide the user with functions for string manipulation and a number of other useful

features. Version 10.02.01 of Extended BASIC also enables the user to load and dump variables, program text, and both text and variables. This latest version is a significant improvement over the earlier version of Extended BASIC in that it allows the user to pass variables from one program to the next.

There has been quite a bit of discussion about the relative execution speed of various versions and brands of BASIC that are on the market. However, the benchmark tests for Heath BASICs that have appeared in the small systems literature have been performed only under somewhat restricted circumstances. In particular, the H8 real time clock was not enabled when Extended BASIC benchmark tests were published, which by omission and implication exaggerates the speed of the 8 K byte version of BASIC. Now, speed isn't the only criterion in evaluating a higher level language's performance, but to provide you with a more balanced perspective on this issue, I give you the following benchmark comparisons between the two versions of Extended BASIC and the 8 K BASIC that comes with the kit.

A modified benchmark algorithm developed by J G Letwin (a software engineer for Heath) was used to conduct all of the tests. All timings were accomplished using the H8 real time clock via the POKE and PEEK commands. Table 1 presents the comparative data for execution time of various functions in milliseconds. The real time clock was enabled for all tests. The algorithm I used is as follows:

```

110 B=1.1:C=1.5 (numeric constants)
120 POKE 8219,0:POKE 8220,0 (set clock = 0)
130 FOR I=1 TO 2000 (2000 iterations)
140 (line for each test function)
150 NEXT I
160 Y=PEEK (8219)+(PEEK (8220)*256)
    (read run time)
170 X=(correction factor for "A=B")
180 T=((Y/500-X)/2000 (time in ms)
190 PRINT "T="";T;"Y="";Y (output)
32767 END

```

Table 1: Comparison of execution times for three Heath BASICs for various common functions, operators, and the FOR/NEXT statement. All times are in milliseconds, with the real time clock enabled.

FUNCTION/ OPERATOR/ STATEMENT	8 K BASIC (Version 05.01.00)	Extended BASIC (Version 10.01.02)	Extended BASIC (Version 10.02.01)
A=B	14.9	15.7	15.8
ABS	1.2	1.2	1.2
+	1.9	2.7	2.5
-	2.2	3.0	2.7
INT	2.3	2.0	2.0
RND	2.4	2.4	2.4
PEEK	3.5	3.3	3.2
*	4.3	3.3	3.1
/	5.2	5.9	5.7
FOR/NEXT	5.4	5.5	5.5
-----	-----	-----	-----
POKE	14.5	13.8	13.7
COS	18.3	15.0	14.6
SIN	19.3	15.7	15.3
EXP	22.1	17.3	17.0
LOG	27.2	21.8	22.0
ATN	29.2	24.9	24.3
SQR	47.8	15.7	15.3

The argument at line 180 computes the time for execution of one operation of the function supplied at line 140 by dividing total time in milliseconds (Y) by 500, subtracting the time for the identity statement A=B, and then dividing by the total number of iterations (2000). Line 140 contains the function being benchmarked across each version of BASIC (for example, 140 A=SIN(B), 140 A=SQR(B)). The POKE and PEEK commands are placed immediately before and after the test routine to be timed, respectively, thus holding any time required to execute these commands constant and to a minimum.

Write faster in BASIC, FORTRAN, or COBOL

Document & modify more easily, too

Human-engineered to do the job better. Yes, you really can get flawless code faster, using the Stirling/Bekdorf™ system of software development tools with structured programming concepts. The 78F2, 78P4, and 78C1 are human-engineered to reduce initial errors, improve de-bugging speed, and aid concept communication.

First, use the 78F2 Flowchartrix™ to lay out your original concept blocks. Then use it to write a finely detailed flowchart.

54% more logic cells than other flowchart forms, put far more of your program on each page. Each Flowchartrix has a full 77 logic cells, not just 50. This saves paper, and makes your finished flowcharts easier to understand. By seeing up to 27 extra steps of a program on each page, you comprehend program flow more clearly. You save money and storage space, too.

Every matrix cell in the 7 x 11 matrix has a specific label to help you track branch points. When you write program documentation, having a separate reference point for each cell makes your program much easier to describe clearly.

With Flowchartrix, you don't need a shape template to draw remarkably regular logic symbols. Guides for the most-used logic symbols are right in each matrix cell, to help you draw most standard flowchart symbols entirely free-hand.

78P4 Print-Out Designers are next. When you finish flowcharting, lay out the printed reports your program will generate. Then when you write code you blaze through the report generation segments right along with the rest of your program.

Unique 70 x 160 matrix accommodates even proportional-spacing word processor formats. The 160-column width can handle practically any printer format. The 78P4 is big, 14½ x 22 inches, because we've scaled the cell size to human writing comfort, not machine print, giving nearly twice the character-writing area of other printout design sheets.

Special 5-column area records the program line number of the code which creates each printed line. It shows, at a glance, exactly which line of code creates each line of your report, saving hours of needless search time when you must change the report format (and don't you always have to, sooner or later?)

Every sheet of 78C1 gives you 2 form uses for the price of one. Use 78C1's full 28 line x 80 column grid area to code regular program steps. Then for interactive or instructional sections, simply keep your characters within the appropriate CRT indicator lines, and you'll automatically know where every character will show on your CRT screen.

28 line x 80 column coding capacity saves you 14 sheets out of every 100, compared to 24-line forms. 86 sheets hold more program steps than 100 sheets of any 24-line form, yet we offer full-size 6mm x 3mm grid blocks to give you comfortable writing room and visual space between lines.

Works with your CRT display, no matter what brand you own. Equipped for both 16 line x 64 column and 24 line x 80 column display formats.

Available in three versions (one for BASIC languages, one for FORTRAN, another for COBOL), the 78C1 is so powerful we include a 7-page instruction manual with every order.

Every tool in the Stirling/Bekdorf system is surface-engineered to take both pen & pencil without blotching. Our tough, extra-heavy, 22# paper is pure enough to use with critical magnetic ink character readers, and gives you crisp, sharp characters with pencil or plastic-tip pen.

Every part of our system uses eye-comfortable soft blue grids. All grid rulings, tints, and division rules are reproduced in a special shade of blue, easy on your eyes even after hours of continuous programming. If you're a professional programmer, you'll particularly appreciate our improvement over the green lines you've been writing on.

A 3-ring binder is one more of our secrets for your success. All your notes, logic concepts, flowcharts, code, CRT layouts, print-out designs, and documentation can be kept together, in order, in one place. When everything you create stays together, debugging and modification is much simpler.

Order your supply of the world's most advanced software development tools, right now, before you hatch even one more bug.

What can we glean from all these timings? For one thing, the 8 K basic BASIC is generally slower than either of the Extended BASICs. The differences in execution times between the three versions is not really significant for the arithmetic functions. On the other hand, the transcendental functions run faster in Extended BASIC. The differences between the versions are most evident when the SQR function timings are compared. It appears that for arithmetic applications, such as those used in most financial accounting, the user can get by very well without using Extended versions. On the other hand, those who plan to do engineering or scientific applications software development should give serious consideration to using only the Extended versions. All of the versions will operate approximately 10 to 15 percent faster if the real time clock is disabled, which might be a further incentive for the scientific programmer to use only the latest version (10.02.01) of Extended BASIC.

Aside from timing benchmarks, there are many other criteria to consider when reviewing a higher level language like BASIC. Since I cannot possibly cover all of them in this article, I'll select the ones which are probably of most interest to many readers. Let's start with the command and function types of the three versions.

8 K Benton Harbor BASIC contains most of the commands and functions found in many commercial brands of BASIC for small systems. It has a set of editing facilities, immediate and program command modes, and a full set of relational operators. It also has additional commands, including PEEK, POKE, SEG (for controlling the H8 LED displays), PAD (for utilizing the H8 control keypad while running BASIC), and several commands for loading and dumping programs. Most 8 K BASIC functions can use variables in addition to constants within their arguments, which makes programming more flexible. This version of BASIC does not provide functions for manipulating string variables.

In contrast to 8 K BASIC, both versions of Extended BASIC have a variety of functions for handling string variables. In addition, such commands as BUILD, DELETE, LINE INPUT and CONTROL make program development easier. Each version makes use of the FREE command, which prints out memory allocation data for the user. The latest version of Extended BASIC also includes commands for differentiated loading and dumping of program text and variable as well as LOCK/UNLOCK commands for file protection. Both versions display the type of data being loaded or dumped on the H8 front panel LED displays. As the data in

table 1 indicates, the latest version is quite fast. Additional refinements, such as incorporating PRINT USING, OCTS and DECS (for octal to decimal, and decimal to octal conversion), and file handling commands that could be executed in program mode (such as PUT and GET), would have been useful. In addition, a special INPUT command that suppresses the carriage return/line feed would also have been useful for formatting the terminal display during INPUT, as would a more flexible RUN command to specify a file/program name for storing and executing one of several programs stored in user memory. This can be accomplished now using a combination of the GOTO and CONTINUE commands. However, this procedure prevents the use of identical variable names in different programs unless such variables are reinitialized before each execution, or the variable values of a previously executed program are to be used as *global* variables in subsequent programs in memory.

A Few Pointers

The following section includes some suggestions about using the real time clock for program run timing, displaying output using user defined patterns or character messages on the LEDs, and using the audio feedback system for any number of interesting projects. By combining and augmenting some of the following techniques, you can use your H8 as a daytime clock, alarm clock, device controller timer, and even a (rather crude) music synthesizer.

Among the applications software packages available from Heath for the H8 are a Space War program and a set of games programs. The Space War game, which requires 24 K bytes of memory is a sophisticated version of Star Trek. It has excellent displays, a full range of commands, and some surprises for those of you who dream of cruising the galaxy. Finally, the games set, which comes on one cassette tape, contains a variety of interesting games, including Craps, Nim, Hexapawn, Tic Tac Toe, Orbit, Hamrabi, and Derby, all stored in machine language and executable without first loading the BASIC interpreter into memory.

In addition to the above applications software, the Heath Company is also planning to market some business software in the not too distant future. This source of applications programs will be supplemented by the software that will become available from the Heath user's group (HUG), which is presently reviewing and cataloging hundreds of programs that are being donated to HUG by users. Software from HUG will be available to HUG members at a nominal cost and will

be announced in the HUG magazine *REMark* as contributed programs become available.

The H8 Real Time Clock

Every 2 ms the H8 generates a level 1 interrupt which is then used to service the front panel and update the real time clock. The clock or "tick counter" is located in two bytes of user memory at locations 040.034 and 040.033 and is called TICCNT. Both the high order byte (040.034) and low order byte (040.033) of the counter can be displayed on the H8 LEDs using the following short assembly language program which can be executed in memory with the assembler (HASL-8) resident:

```

074.000          ORG 074000A
074.000 041 033 040 LIX H,040033A
                LOW ORDER BYTE
074.003 116 DISPLAY MOV C,M
                LOAD LOW BYTE
074.004 054      INR L
                NEXT BYTE
074.005 106      MOV B,M
                LOAD HIGH BYTE
074.006 055      DCR L
                RETURN POINTER
074.007 303 003 074 JMP DISPLAY
                NEXT BYTES
074.012          END 074000A

```

Be sure to set the front panel to display the BC register pair before running the program.

The BASIC timings described earlier accessed the TICCNT memory locations by using the PEEK function and POKE command. Using these commands, it is possible to create a program run timer for programs that run up to approximately two minutes. Unfortunately, after this time TICCNT will start all over again instead of continuing to increment third and fourth memory locations, which would have provided a very convenient built-in extended range timer. You will need to allocate additional bytes in memory for a higher order counter in order to extend the clock range.

H8 Display Control

As discussed earlier, the H8's front panel is an integral part of the entire system and can be used for many operations even while using a console terminal. One of the advantages of this design is that the LED display can be accessed and controlled by the user either through the front panel or through a program being run from a terminal. Much of this is made possible by accessing the monitor control cells and flags stored in memory.

As an example, the assembly language program in listing 1 provides you with complete control of the display updating. First the display update control bit in the user definable memory flag .MFLAG is set to 002 to disable display update. The displays are then loaded with the desired bit pattern, in this case the pattern "XrunningX" (where X = blank). The user accessible memory cells for each LED bit pattern are in memory locations 040.013 through 040.023. The temporary bytes for storing the pattern for this display are in locations 071.000 through 071.010. Each byte in the temporary area is, in progression, loaded into the corresponding byte in the monitor LED memory bytes. To modify the display, change the bit patterns in the temporary area. Add additional temporary bit pattern tables and a table reference and transfer routine to display more than one front panel message.

The H8 Horn

The audio feedback system that is part of the H8 has other practical uses. The audio tone can be turned on from a running program that stores the octal value 160 in the front panel hardware control cell CTLFLG located at 040.011. If an attempt is made to do this from the front panel without going through a program, the front panel will be disabled before the operation is completed. The tone can be turned off by restoring CTLFLG to its normal octal value of 360.

Here is an interesting BASIC routine to generate an audio beep sequence with timing that follows a sine curve. Change the value of X to vary the timing curve. (Note: line number 3 is written in multiple statement form to structure the program to run as fast as possible.)

```

1 X=1
2 A=8201: B=120: C=208: D=20
3 J=J+X: POKE A,B: POKE A,C:
  FOR I=X TO SIN(J)*D+D: NEXT I: GOTO 3
4 END

```

Split-Octal to Decimal Conversion

It is often useful to be able to quickly convert split octal bytes to their decimal equivalents. The following routine does this. It can be located as a temporary program in BASIC while other programs are being developed or executed. Be sure to use line numbers that do not conflict with those in the program you are using. (Note: input N if done.)

```

010 REM OCTAL TO DECIMAL CONVERSION
020 PRINT: INPUT "A=?";N

```

INTRODUCING

The LOW COST Alternative For Factory, Depot, and Field Board Repair.

PHOENIX DIGITAL's LS-100 Series Digital Signature Analyzer System brings uniform test procedures across your factory, depot and field testing. For the first time, manufacturers and service groups can establish repair facilities on a very cost effective basis. More remarkable, you can utilize inexperienced, unskilled labor to troubleshoot, diagnose, and locate faulty components with positive, predictable results. Gives you the ability to KEEP UP with expanding service needs and shrinking pools of qualified service technicians.

New Opportunity

Get into the highly profitable service business without a major investment or using highly-skilled, expensive test personnel. SINGLE-CARD Signature Analyzer Modules provide system-resident diagnostic and failure isolation power of expensive board testers.

Quick Initial Use

Take existing factory and field board test software and exercise one known-good board, taking digital signature servicing values, and adding the values to your service documentation. To repair boards, merely take measurements, match with service documentation for correct four digit values, and faulty backtrack through the logic to isolate components. Complexity of repair is about that of servicing a TV.

Flexible Family Of Tester Types

Versions are available for resident and plug-in use with S-100 and other bus types. Easily controlled by either hardware or software. Automatically scan a large number of test points using optional 32-input multiplexer attachment. Probe with built-in service-oriented logic-state LEDs.

CUSTOM versions available for your bus type or built-in application.

Call or write, today, for full details on the system best suited to your needs: (602) 991-6360.

A Stepping Motor Primer

Part 2: Interfacing and Other Considerations

Paul Giacomo
51 Farmington Chase
Farmington CT 06032

Interface Circuitry

Part 1 of this article ("A Stepping Motor Primer," February 1979 BYTE, page 90) described the theory of operation of the stepping motor. Part 2 concludes the discussion with a description of how to interface stepping motors to microcomputers. The interface can be accomplished in several different ways. The most common methods are to either decode the control sequence in software, outputting it to a parallel port with buffers and connecting the output of the buffers to the drive transistors, or use the output ports of the computer to feed into an external decoder that will sequence the drive. Since personal preference and individual application dictate how much or how little of this will be in the program, I will first describe a hardware version for a 4-phase, full-step drive, then describe how to transfer it to software.

Let us assume that two control lines from an input/output (IO) port are used to control the stepper. One line is for direction and the other is for a step command. The program can then control the speed of the motor by controlling the frequency of pulses on the control line. Figure 17 shows a simple interface circuit. The control lines coming from an output port are buffered and sent over a cable to this circuit, which is in close proximity to the motor. (Avoid high voltage and current spikes near the processor.) The first thing to be done is to clean up the signals and then feed them into an up-down counter. The counter determines in which of the four excitation stages the motor is to be. The outputs of the counter are fed into a decoder section that activates the driver transistors at the correct time.

There is a 16 pin integrated circuit available (SAA 1027) through North American Philips Corporation that can do all of this, as well as including the drive transistors, for under \$10. The program needed for the system is now fairly simple. What must be done is to select the direction of travel and then pulse the step line the correct number of pulses at the desired stepping speed. *Ramping* the speed of the motor is discussed in the following section.

The software version of this system would use four lines of parallel port interfacing directly with the drive transistors, with the excitation sequence stored in the program. To advance the motor, the program either increments to the next sequence pattern and outputs it for forward, or decrements the pattern and outputs it for reverse. Again, the speed of the motor is determined by how fast the patterns are outputted.

Although not covered in this article, there are drives available that allow one to input to the drive the number of steps to travel and then activate the go line. The drive automatically ramps the motor up in speed and then stops at the number of steps set beforehand. These drives are known as preset indexers. Another type of drive uses a voltage level to control an oscillator for the stepping speed.

Behavior of Motors in Operation

Like any other motor, the stepper cannot instantly start and stop at full speed and maximum load and still be expected to end at the correct position.

When a motor takes a step, it behaves in a manner similar to that of a fiberglass pole with a weight on one end, as shown in

Note:

The figure numbering sequences used in this installment continues the sequence begun in part 1. Also, part 1 includes a glossary of terms and a reference list.

Figure 17: Hardware version of step sequence generation for a 4 phase full stepping motor.

Figure 18: Analogy to single step movement in a stepping motor. When the base (electrical position) is suddenly moved to a new position, the fiberglass rod (magnetic force) pulls the suspended weight (shaft and load) along with the base. Because the fiberglass rod is flexible, the weight causes it to shake for a while before stopping. The inertia of the shaft and load in the stepping motor's case is the mass that makes the weight oscillate for a time.

Figure 19: Step position versus time for a typical stepping motor. The actual frequency of oscillations and time to decay is different for every motor and load combination.

Figure 20: Simplified diagram of inertial damping used to reduce overshoot of a motor.

Figure 21: Example of a friction coupled inertia damper.

figure 18. When the electrical position is advanced one step, the magnetic force tries to pull the shaft and load to the next mechanical position. Depending on the drive, inertia of the load, and friction on the load, the shaft will bounce back and forth (oscillate) around the next mechanical position (like the weight on the end of the fiberglass pole) until it has dissipated its energy. Figure 19 is a graph showing position versus time for one step of a motor. This overshoot of the shaft may not be a problem in a low inertia, high friction system, but can cause troubles in a high inertia system with low friction.

To reduce the overshoot some form of damping must be added, the easiest being friction damping. This consists of adding friction to the motor shaft, which opposes any kind of motion and provides energy dissipation during oscillation. Although this method is easy and inexpensive, it reduces the available torque from the motor. This also affects the performance and the final position accuracy of the system.

Another type of damping is known as inertia damping (sometimes referred to as *Lanchester* damping), which is the most commonly used method for mechanical damping. A simplified diagram of this type is shown in figure 20. This type of damper is constructed with a coupling that is somewhat loose and slips like an automobile clutch that is not fully engaged. The coupling will try to bring the damper inertia to the same speed as the motor shaft. When the speeds are equal, there is no friction between the damper and motor, so the damper is inactive. This type of damper does not affect the final position accuracy but reduces the acceleration and deceleration rate of the system. These dampers are much more expensive than the simple friction damper. The inertia of the damper (which is related to the size and weight) has the largest effect on the amount of damping, and must be selected for the particular application.

Two common ways that coupling can be made are by friction or by using a viscous fluid similar to oil. Figures 21 and 22 give examples of friction and viscous coupling dampers, respectively. The friction damper has a disk attached to the shaft and two other disks, or bearings, that are free to rotate on the shaft. By adjusting the springs, the amount of friction between the free disks and the mounted disk can be changed. The viscous damper consists of a cylindrical case attached to the motor shaft with another cylinder that is free to rotate inside the case. Fluid inserted between the two

SOFTWARE HEADACHES?

HERE'S WHAT DEALERS RECOMMEND FOR RELIEF...

Russell F. Roth, President, Roth Computer Processing, Indianapolis, IN: "Bookkeeper and Autoscribe are flexible enough for almost any business application. MicroSource narrows the applications gap between micros and the other guys . . . refreshing for packaged systems."

Chuck Faso, Owner, Computerland of Niles, IL: "You cannot find more for your money anywhere. Autoscribe is the easiest to operate I've seen. It does everything you would want to do with word processing. There's just no competition at this price."

Norm Dinnsen & Dave McDonough, Owners, Computerland of San Diego: "We like to sell systems we can depend on. That's why we sell MicroSource. MicroSource software is more business-oriented, the systems are a lot cleaner and they use good dependable equipment."

"MicroSource has the best documentation we've yet to see. Bar none. We're looking forward to more MicroSource packages."

Autoscribe — The Paperwork Manager™.
Here's the lowest-cost answer to your office paperwork problems. And, the only word processor that's also a small business computer. Less than \$8,000 (under \$200/mo. on a financing lease) with a North Star-based system (sugg. list).

Bookkeeper — The Office Accountant™.
Now you can use the same system used by CPA firms to prepare your monthly statements. What used to take you days now takes just hours. Just \$7595 (under \$200/mo. on a financing lease) with a North Star-based system (sugg. list).

MICRO SOURCE™

cylinders acts as the coupling. By changing the viscosity of the fluid, the amount of damping can be adjusted.

Another damping method uses the control circuit to electronically damp the mechanical oscillations. This is accomplished by giving the motor a quick reverse, then forward pulse, just as it were about to stop at the final position. Although inexpensive, it requires tuning of the pulses to the load, and the motor will be sensitive to fluctuations in load and friction. For this reason, this type of damping is not suggested for most personal computing applications.

Figure 22: Example of a viscous fluid coupled inertia damper.

Figure 23: Typical speed versus torque curve for a medium power stepping motor. The solid line represents the maximum speed-torque combination that the particular motor and drive combination is capable of producing. The dotted curve shows the maximum speed-torque combinations that can be achieved and still start and stop without gradual acceleration or deceleration.

Since the motor cannot normally start and stop at high speeds, some form of acceleration and deceleration must be used. This quickly becomes obvious if the inertia is too large for the initial speed attempted. The motor will make noise and the computer will sequence through the steps, but the motor will not run. Fortunately, this will not harm the motor. To correct this situation, provided that the motor and drive combination is capable of that speed, the motor must start at a speed low enough to turn the shaft and then gradually accelerate to the desired speed. If the acceleration is too fast, the motor will lose synchronism and stop running. To stop the motor, it should be decelerated or it will continue to turn even after the pulses have stopped. As a rule, the deceleration rate can be faster than the acceleration rate.

An operating parameter exhibited by all stepping motors that should be noted is resonance. Every motor has a particular speed at which it has difficulty running. This is called its primary resonance, and it is usually located somewhere between 50 and 150 steps per second. An unloaded motor, when run at its resonance, will have very little torque and may sputter, make noise, stop turning or run backwards. This will not hurt the motor, but it will make the system do a lot of strange things.

To lessen the effects of resonance, a number of things may be done. More friction could be provided by damping, or the drive could be made to deliver less power. The best solution, however, would simply be not to run at that particular speed. When ramping up or down in speed, acceleration through resonance is possible as long as it is only for a few pulses.

The characteristics mentioned above can be found for every motor by examining the motor's speed versus torque curve. Figure 23 shows a typical curve. One point to remember about the graphs is that the curve represents a particular motor with a particular drive, so it is only a rough approximation for a motor with a personally designed drive. The bottom of the graph usually represents the speed of the rotor in steps per second. The side scale shows the torque that the motor can produce. The curve usually shows the maximum torque that can be applied and still start and stop without error. Notice the sag in the curves at low speed. This is where the resonance is located. Under certain conditions, the sag can be very sharp, going down to almost no torque and then back up to several hundred ounce-inches of torque in only 20 to 30 steps per second.

It should be kept in mind that if there is less current in the main drive than what is

An **INFO 2000** DISK SYSTEM gives you a lot less than you expected:

Less Cost

The DISCOMEM Controller board costs us less to manufacture. So your complete INFO 2000 Disk System costs you less — at least \$400 less than comparable disk systems.

Less Hardware

Only three S-100 boards are needed to create a complete, high-performance disk-based microcomputer system—the DISCOMEM Controller Board, a 32K memory board, and any 8080, 8085 or Z80 CPU board. You don't need extra interface or EPROM boards since DISCOMEM contains 2 serial ports, 3 parallel ports and provision for 7K of EPROM and 1K of RAM.

Less Time

The INFO 2000 Disk System is incredibly fast! Using the PerSci Drives with voice coil positioning, disk seek times are up to 8 times faster than with other drives. A full disk-to-disk copy and verification takes well under a minute. Formatting and verifying a new diskette takes less than half a minute. Reloading CP/M* from diskette takes a fraction of a second.

Less Space

The system is remarkably compact, requiring only 1/2 to 1/3 the space taken by other 2-drive disk systems.

Less Hassle

The INFO 2000 Disk System eliminates the "I/O configuration blues" by incorporating all necessary interface ports. A CP/M Loader and all I/O drivers are contained in EPROM so there is no need for special software customization. Just plug the system into your S-100 microcomputer and begin immediate operation using the CP/M disk operating system. The INFO 2000 Disk System is supported by the most extensive library of software available, including 3 different BASICs, 2 ANSI FORTRAN IVs, several assemblers, text editors, debugging tools, utilities and numerous applications packages.

Less Errors

This disk system uses full size 8" diskettes and standard IBM 3740 recording format. So you're assured superior protection against errors, and full interchangeability with other CP/M-based systems.

It all adds up to more capability for your money.

The complete INFO 2000 Disk System comes completely assembled and tested. It includes dual diskette drives, the DISCOMEM Controller, power supply, cabinet, cables and the CP/M disk operating system—everything you need for immediate plug-in-and-go operation with your microcomputer. This means less time, hassle, hardware, space, errors and less money than for comparable equipment. Now, isn't that a lot less than you'd expected in a dual disk system?

INFO 2000 Disk Systems are also available for Digital Group and Heath H8 microcomputers. Dealer inquiries welcomed.

Figure 24: Spring scale torque measurement. The torque of a stepping motor at a set speed is measured by pulling slowly on the nylon cord wrapped around the pulley until the motor stalls. The reading on the scale times the pulley radius gives the maximum load torque the motor can run with at that speed. The amount of turns around the pulley varies with the pulley and cord. For a 3/32 inch (0.25 cm) diameter cord and aluminum pulley, two or three turns works best. By measuring the torque at several speeds, it is possible to make a special torque curve for the motor and drive.

The following list contains various sources from which stepping motors and pertinent literature may be obtained.

Manufacturers:

Superior Electric Co, Middle St, Bristol CT 06010.

Sigma Instruments Inc, Motion Control Div, 170 Pearl St, Braintree MA 02184.

North American Philips Control Corp, Cheshire Industrial Park, Cheshire CT 06410.

Warner Electric Brake, MCS Div, Beloit WI 53511.

Computer Devices of California, 11901 Burke St, Santa Fe Springs CA 90670.

Singer Co, Kearfott Div, 1150 McBride Av, Little Falls NJ 07424.

Berger-Lahr, Jaffrey NH 03452.

Surplus Stepping Motors and Equipment:

AST/Servo Systems Inc, 930 Broadway, Newark NJ 07104.

Some Stepping Motor Calculations

The following formulas are commonly used in stepping motor calculations.

Distance = $s = \frac{1}{2}at^2 + v_0t + c$ where s = distance (inches or cm)
 a = acceleration (inch per second²)
 t = time (seconds)
 v_0 = velocity, initial (feet per second or meter per second)
 c = constant.

Velocity (linear) = $v = at + v_0$ where v = velocity (inch per second or meter per second)
 a = acceleration
 t = time
 v_0 = velocity, initial.

Velocity (angular) = $\omega = v/(r\pi)$ where ω = angular velocity (radians per second)
 v = linear velocity (inch per second or meter per second)
 r = radius (inches or meters)

$\omega = (\text{RPM}) N/60$ where RPM = revolutions per minute
 N = number of steps per revolution
 ω = angular velocity in steps per second.

(Similarly, the speed in revolutions per minute is $\text{RPM} = \omega 60/N$.)

Torque = $T = Fd$, where d = radius from pivot point to force
 F = force applied or restraining force, ie: friction, weight, load (ounces or newtons).

The relationship between torque and rotary motion is:

$T = J (\omega/t)$ where T = torque (ounce-inches or newton-meters)
 J = moment of inertia (ounce-inch-seconds² or newton-meter-seconds²)
 ω = angular velocity (radians per second)
 t = time (seconds)

To use the equation with J in units of ounce-inches², multiply the inertia by 1/384 (ounce being a unit of mass in this case, instead of a unit of force as used above).

$T = J (\omega/t) (1/384)$

The moment of inertia for a rotating disk (pulley, gear, etc) is:

$J = Wr^2/2$ where J = moment of inertia
 r = radius of disk
 W = weight of disk

L/R Time Constant

The ratio of the inductance to resistance of a winding is used to determine the buildup or decay of current in a stepping motor. The basic equation which represents current flowing in a stepping motor is as follows:

$I = I_{ss} (1 - e^{-t/(L/R)})$ where I = instantaneous current (amps)
 I_{ss} = steady state current in winding (amps)
 e = natural exponent = 2.718
 t = time (seconds)
 L = inductance in winding (henries)
 R = total resistance in the current path (ohms)

By examining the formula closely, it can be seen that the instantaneous current will reach its steady state value much sooner if the ratio of inductance to resistance is decreased. The result is that the motor will react faster to input signals, which will increase system performance.

shown for rated current, the curve will be shifted below the rated curve. A speed versus torque curve of the motor to be used will help to make the design much easier, and without unexpected disasters. By trying to operate safely below the curve, and observing the design rules, no unforeseen problems should be experienced with the system.

Once the motor has been selected and the drive fully completed, the next logical step is to make a speed versus torque curve of the motor and drive combination. This is important for a number of reasons. First, the speed versus torque curve obtained is the actual response of the motor and drive combination rather than a representative curve provided by the manufacturer. Second, it becomes a reference to compare against if any changes in the drive are made to alter its performance. Another reason for obtaining a curve is that it gives the experimenter a hands-on feel of the behavior of the stepping motor. (See text box for a detailed method of finding the torque of a stepping motor.)

I hope the information presented in these two articles will inspire you to use the versatile stepping motor for your own applications. ■

Obtaining the Torque Curve: A Practical Technique

A simple technique for obtaining the curve is through the use of a spring scale (small fishing scale will serve the purpose) and a thin nylon cord. In this system, a cord suspended from a spring scale is wrapped several times around the motor shaft (or a lightweight pulley on the shaft) and is used to apply a frictional torque on the motor (see figure 24). Changing the size of the pulley will provide several ranges of torque. To find the torque, the motor is run at a constant speed and the free end of the cord is pulled very slowly. As friction builds up, the scale will begin to move. At the point where the motor stops turning, the value on the scale times the radius of the shaft (pulley) gives the maximum torque for that speed. This should be repeated several times to get the correct reading. This is repeated for several different speeds. The typical speed points taken start at 50 steps per second and proceed in increments of 50 steps per second up to 250 steps and then every 200 steps per second thereafter. Other points to find are the maximum torque point, maximum speed no torque point and resonance points. When enough points are taken to get an idea of the curve (about 10 to 15), the points are plotted on regular graph paper and a "best fit" curve is drawn through the points.

Warning: *Be careful at low speeds, because the motor can run backwards when it is "jerked" out of synchronism and wind the cord around the shaft in the reverse direction (your finger can get wrapped in there in larger motors). A thin nylon cord is preferable because of its strength. A point to remember is that this is a frictional load and that the shaft (pulley) and cord will heat up when trying to dissipate the energy.*

Build a Computer Controlled Security System for Your Home: Part 3

Steve Ciarcia
POB 582
Glastonbury CT 06033

Copyright © 1978 by Steven
A Ciarcia. All rights reserved.

There are many security systems on the market. From the simple \$10 door buzzers which signal forced entry to elaborate professionally installed Rollins and ADT systems, their purpose is singular: give the occupant advance warning of an emergency condition. Protection of property is a secondary benefit of the more sophisticated alarms. Ultimately it is the overall complexity of the security system that defines how much coverage is attained in each of these areas.

Forced entry, prowler, and fire detection are but three possible events for which people buy alarms. A \$15 smoke alarm alerts the occupants, who rush out of the house in the nick of time but stand watching the house burn because they didn't have time to call the fire department. Similarly, a prowler breaks into a home when the family is out. He has grown accustomed to the regular pattern of timer controlled lights after observing the house for a few nights and immediately disables the alarm horn upon entry. Had the occupants been home they of course would have been alerted to the break-in, but that was not the thief's intention.

To provide full protection, the ultimate security system should discourage intrusion, monitor all potential emergency situations and have the intelligence to initiate a preset series of actions should the alarming event ever occur. Combining all these elements

into a single computer controlled security system is the subject of this and the two preceding articles (January 1979 BYTE, page 56; February 1979 BYTE, page 162). With the control system proposed and developed in this series, the user will have more of a process control computer than a burglar alarm. Except for the detection of the alarming event itself, a system designed to discourage intrusion and automatically respond to certain situations cannot be configured solely as a passive detection unit. The programs which this computer executes either in response to timed events or sensor inputs amount to a process control situation.

The computer controlled security system outlined in these three articles has the capability (presuming you have wired the same output controls as I have) to detect cars or people approaching a residence and track them by sequentially turning on flood lights aimed to cover the perimeter of the house, or give an audible warning in daylight situations. It can also control the power to AC appliances (TV, lights, stereo, etc) either to simulate occupancy or provide the luxury of remote control. This same software allows preset responses to water and temperature sensors for the control of wood heating, water circulating stoves or simply to turn on a pump in the basement. Should any perpetrator be ignorant enough to break in even after sufficient warning, the system has all the usual bells and whistles, an automatic telephone

dialer, a hidden video tape recorder to obtain evidence, and, finally, a separate communications link to your neighbor.

The first article presented a general outline of the control system, the types of inputs available, and proposed responses. The second article described the hardware modifications to the SDK-85 computer used as the controller and provided an extensive description of the control and data acquisition software. With these three articles, more advanced readers should have enough information to configure a similar control computer using any microprocessor.

The final installment in the series presents examples of discrete input sensors to monitor temperature, moisture, motion, fire, and smoke. To allow the computer to make the proper response to such inputs, designs for flashing lights, strobes, siren, and AC remote control interfaces are also detailed. Finally, just to alleviate any lingering apprehensions over what appears to be a complex software algorithm, we will trace the flow of an alarm input as it is processed by the security system and demonstrate the versatility of table-driven software in this application.

The Alarm System Is Only as Good as Its Input Sensors

The SDK-85 has 38 bits of parallel I/O (input/output). In this application 18 of these bits have been set aside to control outputs, while the remaining 20 are used solely for input. Because the computer is composed of TTL (transistor-transistor logic) circuitry, any input to it must also be TTL compatible. It is a further requirement that all signals be discrete in nature. That is, they change state from a 1 to a 0 or a 0 to a 1 level when the set point is attained. Analog inputs are not beyond the capabilities of the software, but no analog to digital interface has been built into the system.

Analog Input Sensors

Temperature and voltage are important analog parameters which any sophisticated alarm system requires if it is to monitor freezer or furnace room temperature and brownout conditions. The circuit of figure 1 can be used to read temperature setpoints. IC1 is a special integrated circuit having an output voltage proportional to temperature.

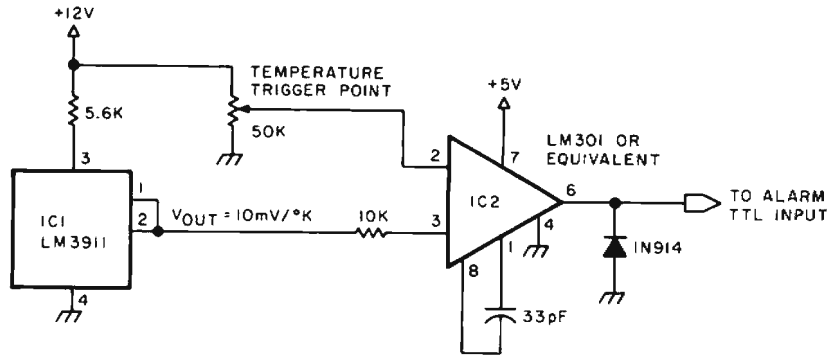

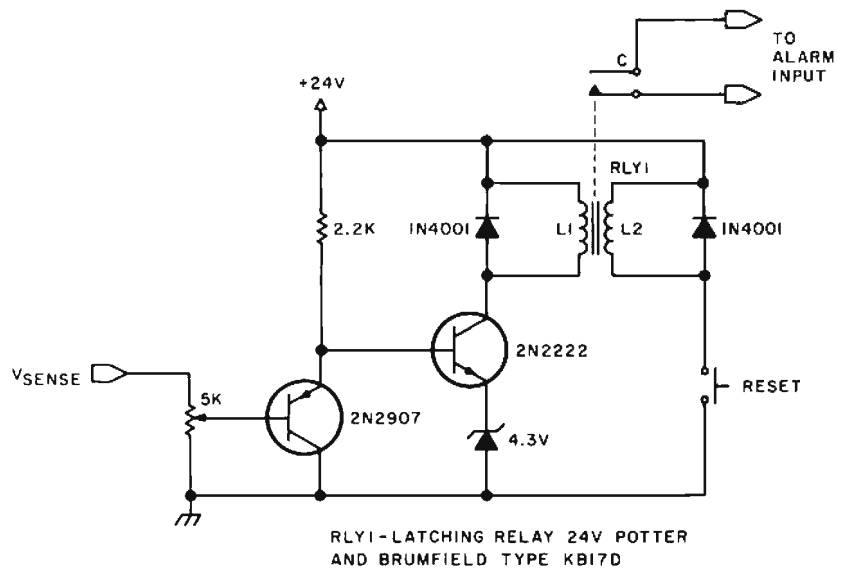

Figure 1: Temperature setpoint indicator circuit. IC1 is a special integrated circuit whose output voltage is proportional to temperature. The circuit feeds into an Intel SDK-85 single board computer, which accepts only TTL (transistor-transistor logic) level inputs. Op amp IC2 is used as a computer to convert the output accordingly.

AC TO DC CONVERTER TO MONITOR POWER FAILURE OR BROWN OUT CONDITION

Figure 2: Circuit which can be used to monitor any DC voltage between 0 and 24 V. A latching relay is used to latch on when a voltage transient occurs.

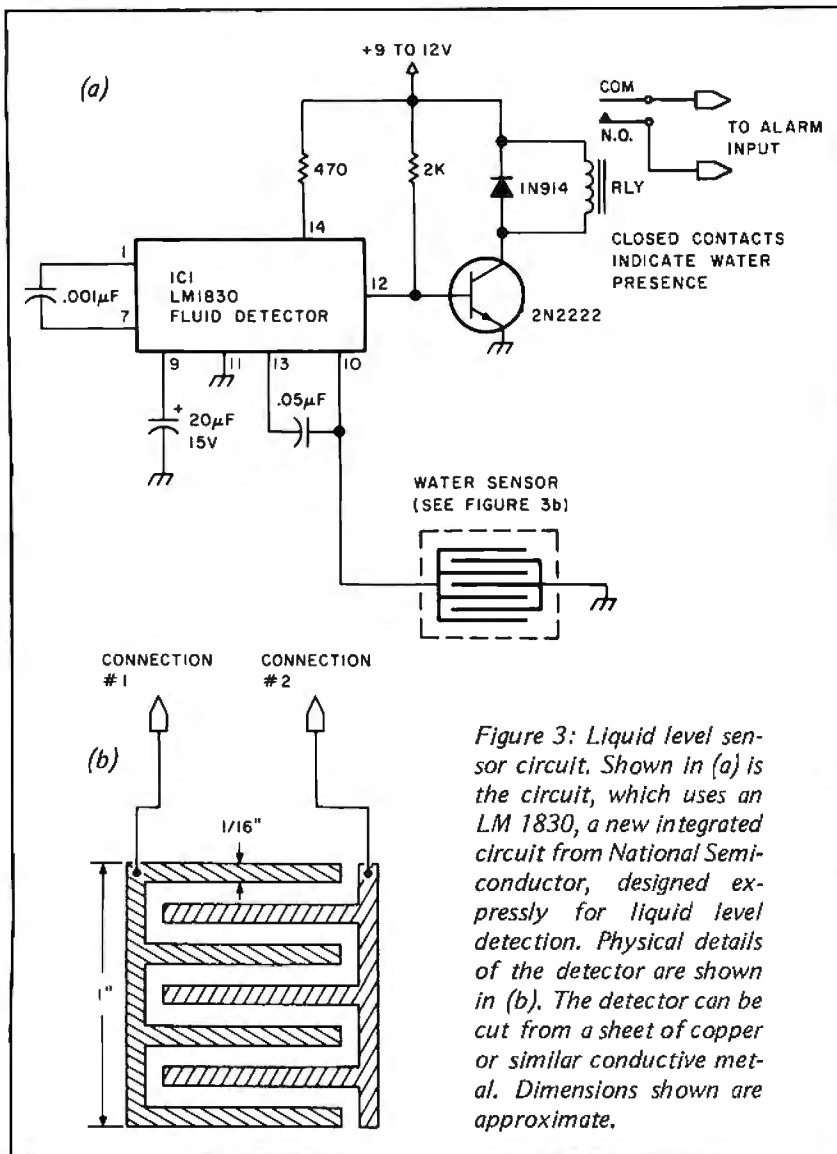

Figure 3: Liquid level sensor circuit. Shown in (a) is the circuit, which uses an LM 1830, a new integrated circuit from National Semiconductor, designed expressly for liquid level detection. Physical details of the detector are shown in (b). The detector can be cut from a sheet of copper or similar conductive metal. Dimensions shown are approximate.

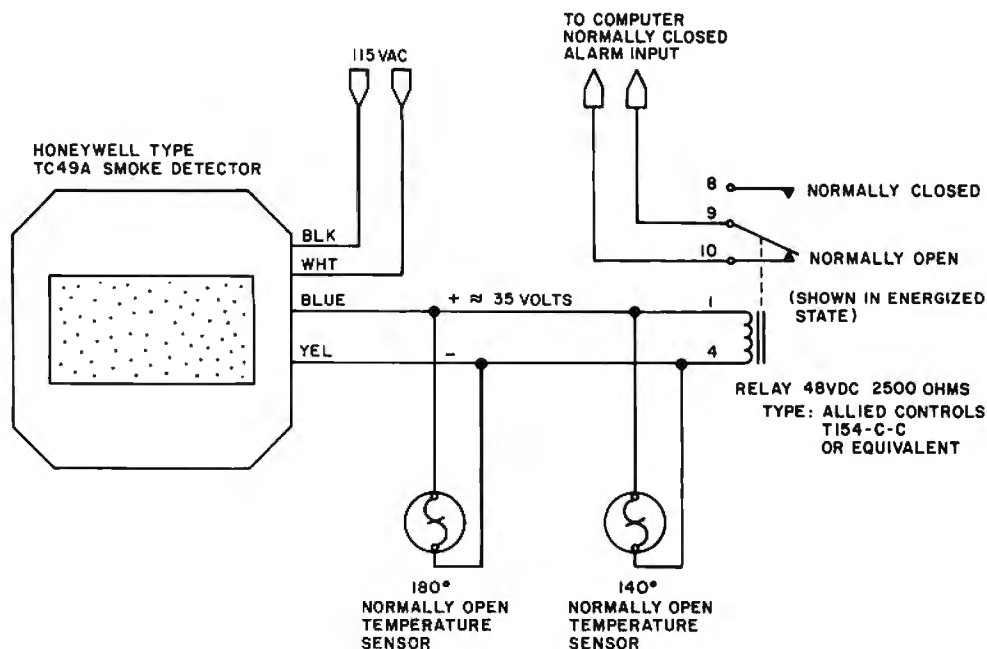

Since the SDK-85 can respond only to TTL inputs, op amp IC2, configured as a comparator, changes logic levels when the output of IC1 equals the setting of the temperature trigger pot. IC2 is powered by a 5 V power supply so that the output is TTL compatible. If a multiple array of temperature transducers is to be constructed, use an LM339 quad comparator instead of four LM301s to reduce wiring complexity. Another analog circuit, shown in figure 2, can be used to monitor any DC voltage between 0 and 24 V. It could be used to monitor the battery back-up supply to the computer or some other important parameter. Since voltage fluctuations are often significant and desirable to catch, the circuit uses a latching relay to keep it in the set condition once triggered. If that is not a desirable feature, then replace RLY1 (relay 1) with a nonlatching type. A relay should continue to be used, however, because it isolates the computer from the monitored voltage sources.

Discrete Input Sensors

Actually, all inputs to the computer are discrete, and this need not be a separate category. The outputs from the sensors are primarily contact closures for a reason I'll explain later. Some of the important ones worth considering are liquid level or moisture, smoke and fire, and ultrasonic and infrared interrupted beam motion detectors.

A liquid level sensor suitable for detecting basement flooding so that a sump pump can be turned on is illustrated in figures 3a and 3b. This circuit uses a new integrated circuit from National Semiconductor specifically

Figure 4: Commercial smoke detector with additional temperature sensors and data acquisition output added. Additional sensors may be added in parallel.

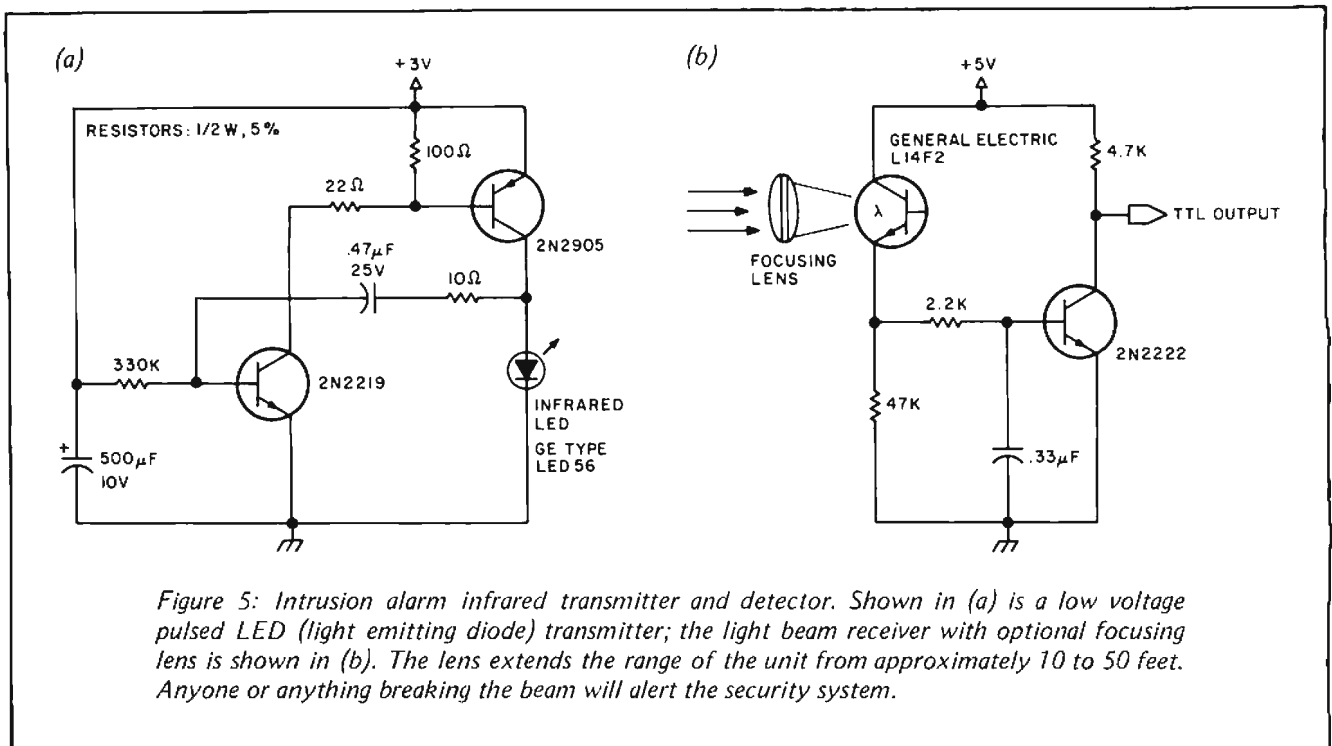

Figure 5: Intrusion alarm infrared transmitter and detector. Shown in (a) is a low voltage pulsed LED (light emitting diode) transmitter; the light beam receiver with optional focusing lens is shown in (b). The lens extends the range of the unit from approximately 10 to 50 feet. Anyone or anything breaking the beam will alert the security system.

designed for this purpose. As configured, the relay contacts will close in the presence of water or condensing moisture. The circuit is extremely sensitive and can be used with practically any conductive liquid.

Probably the most important sensors on the security system are the ones that detect fire and smoke. A commercially available ionization type smoke detector, shown in figure 4, has been configured to interface to the computer. The AC powered TC49A by Honeywell is ideally suited for this purpose, since it is designed for parallel attachment to other sensors. In this instance any number of normally open temperature sensors can be attached between the blue and yellow output leads of the device. Should any of these sensors or the smoke detector itself detect an alarm condition, the 35 V normally present on these wires will drop 2 V. The relay which had previously been in an energized state will open, signaling the event to the computer. Protection must be provided during power failures, however, so that the computer (which has an emergency supply) does not detect a false alarm. If the program which scans the smoke alarm also checks the power failure sensor, positive results should be obtained. In any case it is always a good idea to have a battery powered smoke detector also within the residence.

Note that the majority of sensor designs presented in this article can be used independently. The device normally activated when the sensor signals an alarm condition

can be attached and directly controlled through another parallel set of relay contacts. An example would be the water detector that automatically turns on the sump pump. Requiring the computer to receive the signal, process the control record, and turn on an AC powered pump would be a waste of wire. The computer need know only that the high water mark has been reached to notify the residents on the display panel: it does not have to control it as well. Before you string a mile of wire through the house, consider what functions really need "computer" rather than "local" control.

The two remaining special input sensors are related in purpose. Both are used to detect an object or person passing between two points, and both use interrupted beam sensing techniques. One is an infrared light beam and the other is ultrasonic. The light beam circuit is shown in figure 5 and the ultrasonic circuits are illustrated in figure 6. The range of the infrared unit is about 10 feet without a lens and as much as 50 feet with proper ambient light shielding and a focusing lens. No focusing was tried on the ultrasonic unit, but 25 feet was easily achieved.

Testing and alignment of the ultrasonic transmitter can be tricky, while the infrared is simply a mechanical alignment consideration. First, the transmitter must be tuned to resonance. The nominal frequency of the ultrasonic transducers can be 34 to 42 kHz; they should be bought in pairs. An oscillo-

scope should be put across the transducer in the transmitter circuit when power is applied. Coils T1 and T2 should then be adjustable to produce the greatest amplitude across the transducer. The usual value is about 30 V peak-to-peak and the frequency should be the nominal F_0 listed for the part.

Once the transmitter is tuned, place it about 2 feet in front of the receiver. Adjusting the center frequency adjustment pot should cause the relay to pull in and the LED (light emitting diode) to light. The transmitter and receiver can now be placed across a driveway or large room.

Wireless Inputs

So far we have only discussed input sensors which are directly wired to the

connectors of the SDK-85 computer. If a reed switch were attached to the garage door a wire must be run from it to the computer. In a larger house this can amount to a lot of wire and can extend system construction time. One possible solution is to use a wireless transmitter and receiver between the computer and remote points within the house.

Homebrew wireless transmitters, while cheap, suffer from a lack of reliability. They are not being considered for this application because there is a commercial unit available which is both cost effective and reliable. The particular device is the Norelco Home Patrol wireless burglar alarm system available in most discount stores for about \$200. It consists of a receiver, four contact-closure-activated transmitters, and a smoke

Figure 6: Medium power ultrasonic transmitter (a) and receiver (b). As with the infrared system in figure 5, interruption of the ultrasonic path will alert the security system.

NOTE: THE ULTRASONIC TRANSDUCER USED IN THE TRANSMITTER AND RECEIVER MUST HAVE IDENTICAL f_0 .

Photo 1: Norelco wireless alarm system. The three components from left to right are: wireless smoke detector, wireless door sensor, and master receiver.

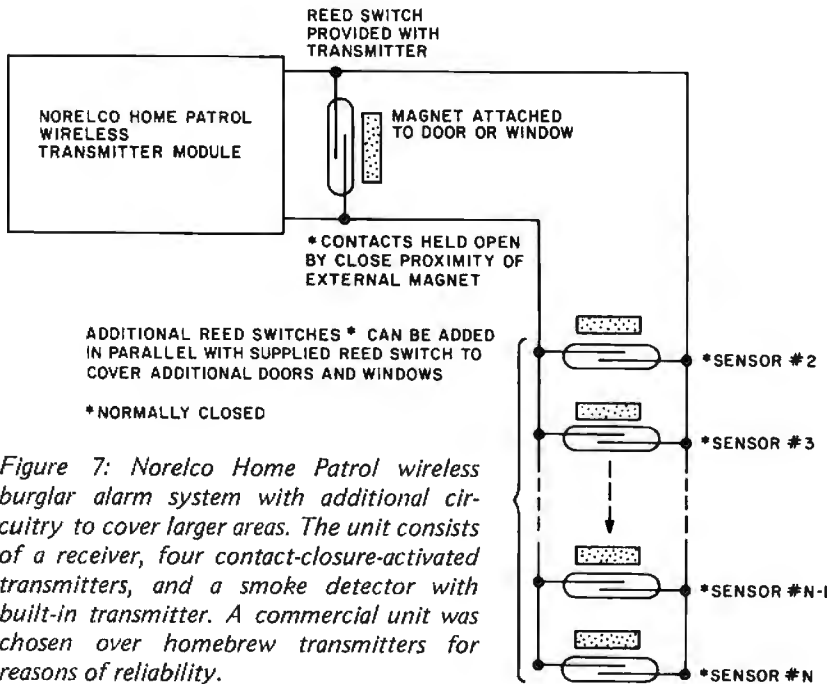

Figure 7: Norelco Home Patrol wireless burglar alarm system with additional circuitry to cover larger areas. The unit consists of a receiver, four contact-closure-activated transmitters, and a smoke detector with built-in transmitter. A commercial unit was chosen over homebrew transmitters for reasons of reliability.

detector with built-in transmitter. Photo 1 shows the components of the system and figure 7 details how each of these separate transmitters can be expanded to cover a wider area.

The Norelco receiver has four separate output channels designated as fire, intrusion, car, and miscellaneous. Transmitters are supplied for intrusion and fire only – transmitters for the other two channels must be purchased separately. Photo 2 shows one of these devices.

Photo 3 shows the output connections of the receiver and figure 8 illustrates the type of interface which must be constructed to convert the 0 and -15 V Norelco receiver outputs to be TTL compatible. Only then can the security system be aware of these remote alarm inputs.

Security System Outputs

Once an alarm condition has been detected or the event processor activated, the security system responds accordingly. Whatever the cause, the output will be a TTL change of state which can be used to drive a mechanical or solid-state relay. Typical output interfaces are warble alarms, high intensity flashers, and strobe lights. They are shown in figures 9, 10 and 11, respectively.

AC output control can be handled in either of two ways: solid-state or mechanical relays. While solid-state relays are definitely the more modern approach, it is very difficult to find control panels incorporating them which are understandable to electricians or which meet local electrical codes. Rather than fight the system it was easier to install a readily available relay control panel as shown in photo 4. The two cabinets on the right are relay cabinets, and the one on the left is the regular breaker box. Each relay enclosure contains six relays. The left relay enclosure controls the six outside light circuits and the righthand enclosure remotely controls six wall outlets around the house. The relays are DC input and can either be controlled directly from the computer or manually from scattered points around the house. Each of the 12 relay outputs requires a separate cable to the outlet or light to be controlled. This is not an inexpensive control method, but it does meet the code and is a convenience once installed.

Two other details left to be considered are the emergency power supply to the com-

Photo 2: Single wireless transmitter with one reed switch attached to it. Multiple reed switches can be attached in parallel to cover a wider area, as described in the text.

Photo 3: Output connections of the Norelco receiver. Using the circuit described in figure 8, the outputs of the Norelco receiver can be easily interfaced to the computer. There are four distinct output channels of the Norelco unit. As purchased in its basic form it comes with transmitters for fire and intrusion only.

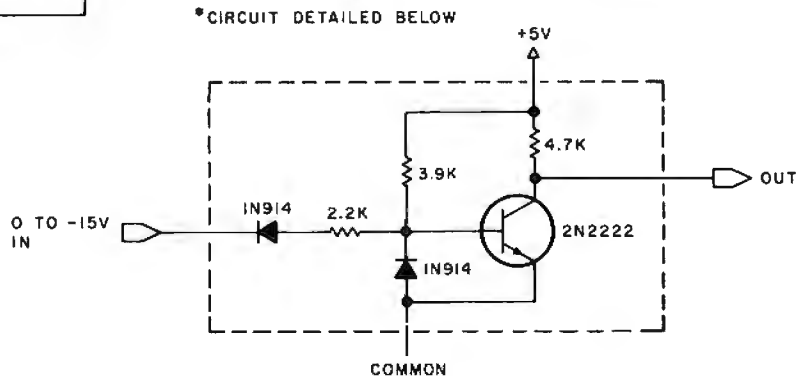

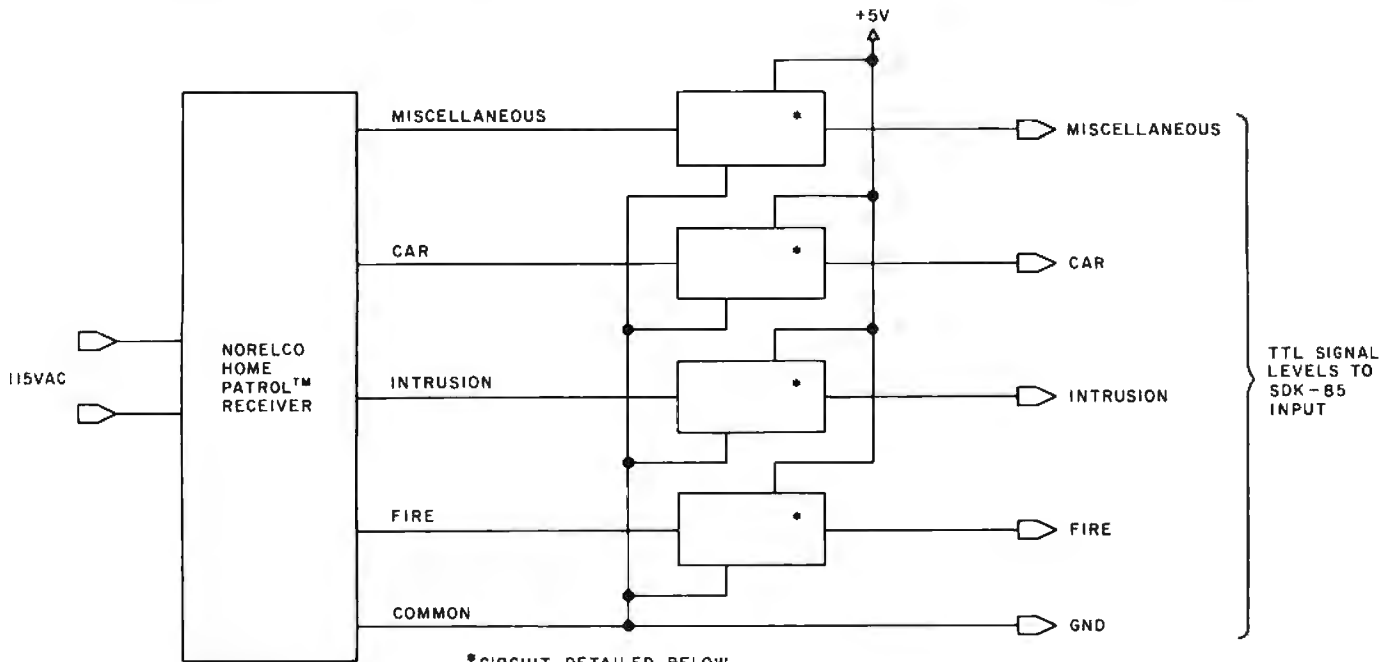

Figure 8: Details of the Norelco Home Patrol receiver showing how it is connected to the central computer.

Figure 9: CMOS warble alarm.

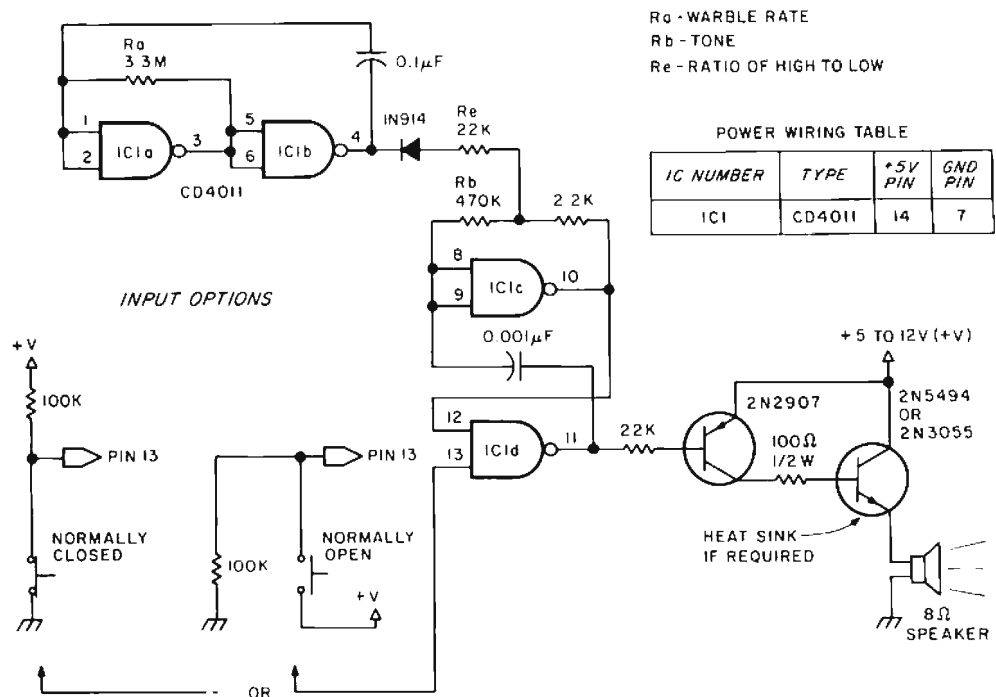

Figure 10: 115 VAC incandescent lamp flasher.

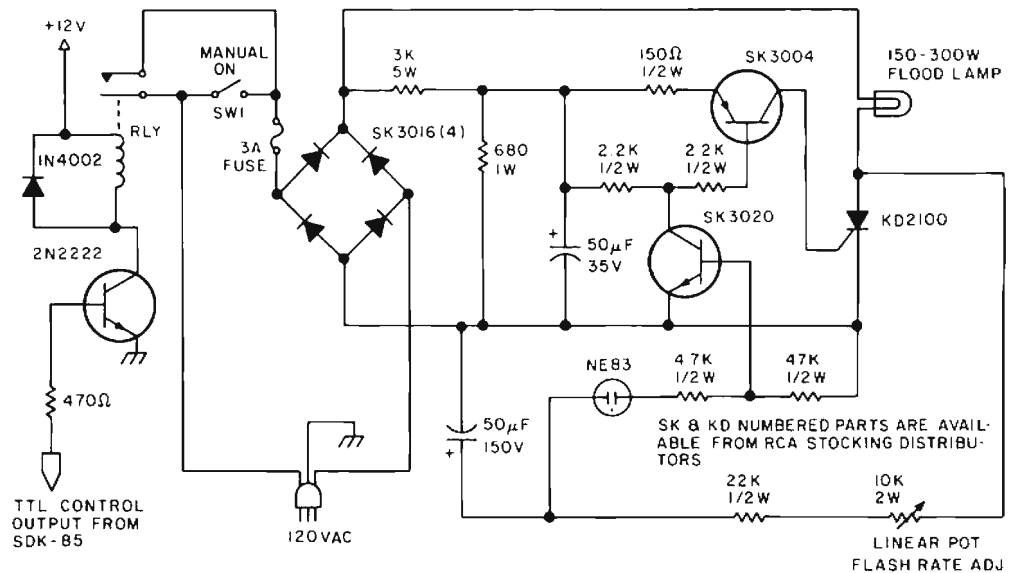

Figure 11: 115 VAC Xenon strobe light. Parts for this circuit are available from Chaney Electronics, 2010 W Dartmouth Unit # 8, Englewood CO 80110.

We Start With A Price That's Hard to Beat.

And We Don't Stop There.

Central Data Corporation has combined the benefits of new technology and high-volume company sales to bring you a RAM board with more features and product options for less money.

Lower Prices More Memory Capability

To begin with, we've reduced the price of our 16K RAM board by \$40 to \$249. At \$425—a price reduction of \$50—our 32K board costs less, too. Plus, we now offer a full 48K memory board for \$599. These boards are expandable to 64K at a price of \$185 per 16K package. Or you can start right out with a full 64K board for \$775.

Improved Board Design

We've also added improvements to the board design at no extra cost to you.

- **Deselectable in 2K increments.** Our deselect feature enables you to switch off any 2K to avoid overlap with your existing memory.
- **Fully socketed memory.** This feature enables you to expand the memory board yourself.
- **Plug selectable addressing.** Now you can re-address without soldering.

Other Standard Features

- S-100 and Z-80 compatible
- Fully assembled, tested, and burned-in
- Power-saving dynamic board with on-board invisible refresh
- One-year guarantee on parts and labor

Specifications

Storage capacity	16K, 32K, 48K, or 64K
Addressing	16K boundaries
Max input load	One LS TTL load
Output buffering	On all data lines
Access time	450ns
Cycle time	480ns
Wait states generated	None
Maximum DMA rate	1 Mhz

Power Consumption (typ)

+16	150ma
+ 8	300ma
-16	20ma

Other Products From Central Data

Central Data also offers, fully-assembled and in kits, a range of other computer products including (pictured above) our 2650 micro-processor, software packages, television monitor, ASCII keyboard, and (not pictured) floppy disk system, to name just a few.

Contact Your Local Dealer

To order our RAM board and for more information, contact your local computer dealer. If unavailable locally, the board and other Central Data products can be ordered directly from us. And, as always, we welcome any questions that you have about our products.

Figure 12: Bedside annunciator panel used to display the status of the home security system.

puter and the display panel located in the bedroom.

The Alarm Status Display Panel

The purpose of the alarm status display panel is to provide the resident with a graphic representation of the status of the security system. Figure 12 is a sketch of a simple annunciator (the picture was omitted because the control panel I finally built bears no resemblance to the purpose we are discussing, and might be confusing since it contains numerous additions to the basic concept).

The circuit (see figure 13) is simply a BCD (binary coded decimal) to decimal decoder driver which is multiplexed by a 3 bit output from the SDK-85. The computer sequentially sends out the codes for the particular lights to be lit. This is done repeatedly and with sufficient speed so that they appear constant. If the annunciator panel is more than 50 feet from the computer, the user may want to consider the addition of the line drivers also described.

Emergency Power Supply

Should power ever be lost in the residence, it is important to maintain the security system in an active mode. To do this a 12 V automobile battery is used to

power the computer *all the time*. The SDK-85 5 V power is derived from the 12 V through a regulator. The EROM (erasable read only memory) can be either a single +5 V unit such as a 2716; or, if using a 2708, the -12 V can be derived using one of the circuits outlined in my article "No Power for Your Interfaces? Build a 5 W DC to DC Converter" (October 1978 BYTE, page 22). The requirements of such a power supply are maintenance of the 12 V on the battery, recharging the battery as it needs it, and also providing standby power to critical sensors and alarms.

Tracing an Activated Alarm Condition: An Example

Part 2 of this series (February 1979 BYTE, page 162) emphasized the software of our computerized home security system. To adequately complete the description of this design, it is necessary to include an example which illustrates the use of table driven software. Included is a listing of the digital scan module and various response modules which should aid in understanding.

Suppose one of the functions of the system is to respond to a smoke and fire detector. First, assume that the sensor in question is wired into the least significant bit (bit 0)

on port 0. Response to this sensor is on a reset-to-set (0 to 1) transition, and that on a set-to-reset (1 to 0) transition no action is to be taken. As detailed in part 2 of this series, the initial state change is detected by DIGSCN (the digital scan module) which uses the information contained in XFVE (the sensor state transfer table) to initiate the processing of a digital event. If you recall, the sensor state transfer table is comprised of four byte records, with one record being required for each digital input:

Sensor State Transfer Record

- Bytes 0 and 1: event record address for reset-to-set transition plus active/inactive flag (bit 7);
- Bytes 2 and 3: event record address for set-to-reset transition plus active/inactive flag (bit 7).

The smoke and fire detector connected to bit 0 input uses the first record in the sensor state transfer table to initiate the required responses. Since no action is required for a set-to-reset transition, bytes 0 and 1 are set equal to hexadecimal FF. This makes such a transition inactive (active/inactive flag = 1). We do, however, want to process a smoke and fire alarm. Therefore, bytes 2 and 3

must contain the address of the event record associated with the alarm. For this example let us assume that the address of the event record used to process this alarm is at hexadecimal 4214 (therefore byte 2 of the transfer record will equal hexadecimal 14 with byte 3 being equal to 42):

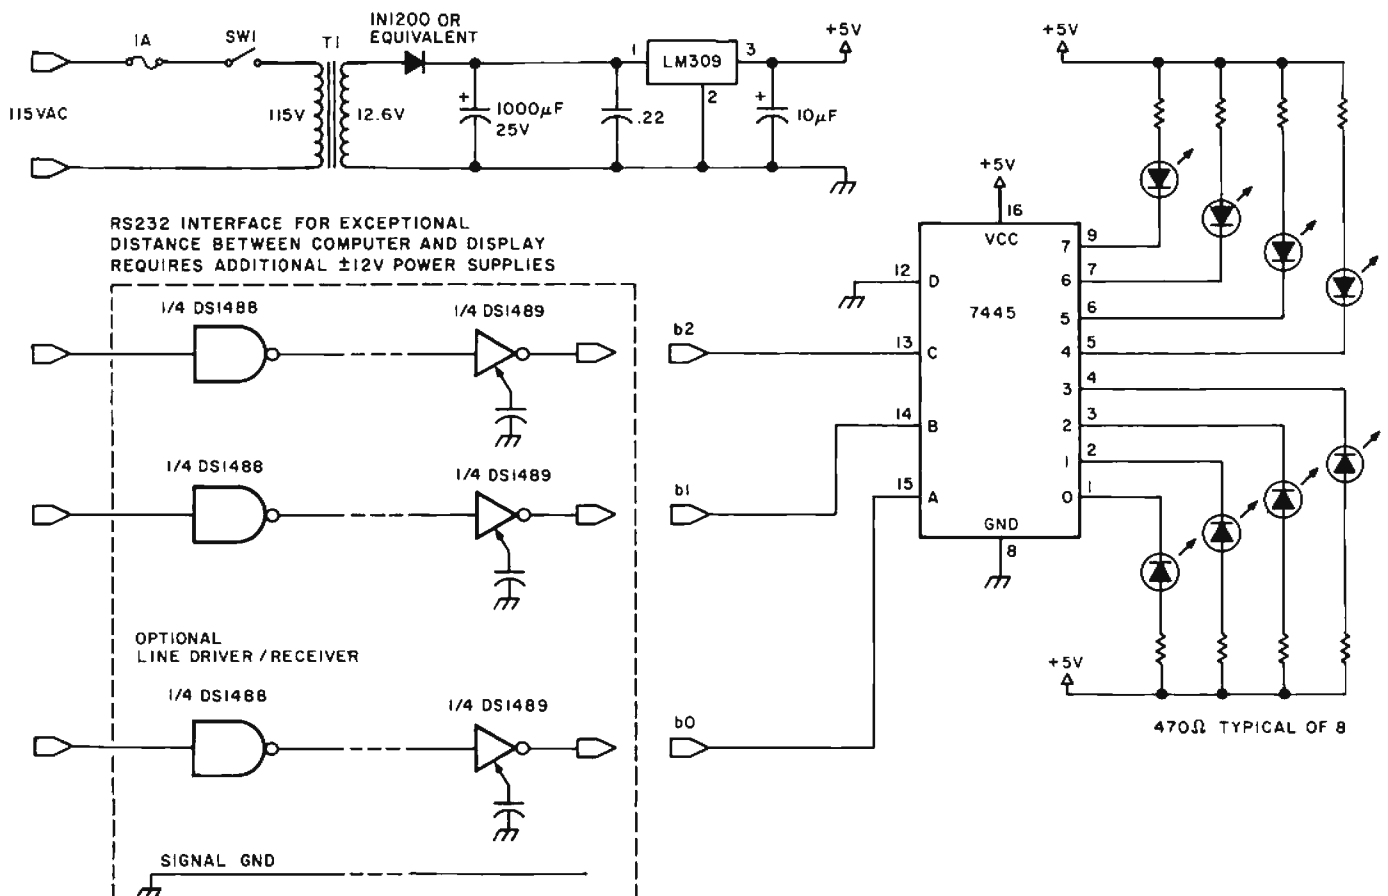

Sensor State Transfer Record for Smoke and Fire Alarm

- Byte 0 = FF;
- Byte 1 = FF;
- Byte 2 = 14;
- Byte 3 = 42.

To summarize, the digital scan module detects the transition of the smoke and fire sensor from a reset to a set state. Using the information contained in the sensor state transfer table, the system processes the event by first extracting the address of the event record associated with this alarm and then activating EVPRO (the event processor module).

EVPRO (the event processor), which is used by the event record processor, contains the indices to the various response records associated with this alarm. As you may recall, one of the features of this system is its ability to associate several responses to

Figure 13: Driving circuitry for the annunciator panel (see figure 12). A BCD (binary coded decimal) code from the computer is converted to decimal by IC7445 to drive the LEDs on the panel, which are driven sequentially with sufficient speed so they appear to be lit constantly. An optional RS-232 interface for driving the circuit at some distance from the computer plus a 5 V power supply are also shown.

Photo 4: Electrician Vince Sadosky installing "Touch Plate" control system. Each enclosure (of the two on the right) contains six 15 A latching relays. The relay is a pulse on/pulse off type in which the control pulse can come from either a manual pushbutton panel in the kitchen or from the computer.

a single event. The event record is the mechanism which accomplishes this as follows:

Event Record Format

Byte 0: number of responses associated with record;
 Byte 1: relative index of response record *i*;
 Byte 2: relative index of response record *j*;

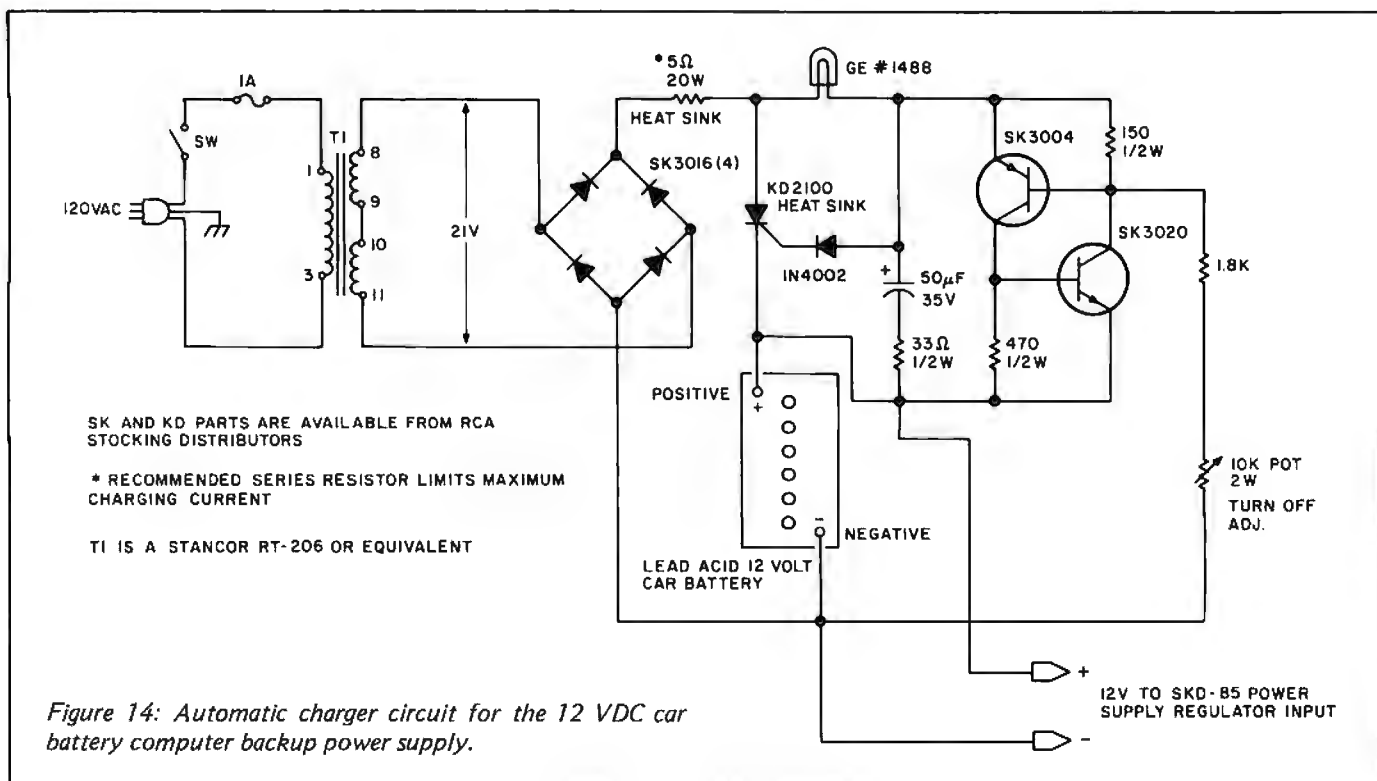

Byte *n*: relative index of response record *z*.

Initially the response might be to activate the autodialer notifying the police and fire departments of the predicament. But before doing that, let us take a few seconds to check for a false alarm and, if possible, verify the situation. This can be accomplished with the following responses to the alarm. First we do want to initiate the autodialer. So, our first response will be the initiation of a 60 second delay of the autodialer. Next, since we may be in the bedroom and unable to hear the alarm itself, we will initiate an audible alarm — and, so that we can tell the location of the alarm, we will display the location of the alarm on the annunciator panel.

These functions will require an event record containing the indices of the following responses:

- Delay timer activation for the 60 second delay.
- Application task response for driving the annunciator.
- Digital output response for activating the audible alarm.

In this example it is assumed that the response indices are 0, 1, and 2, respectively. The event record for this event will therefore be four bytes in length as follows:

Please Sir—Could you tell me where I can Find Software for my Microcomputer?

SOFTWARE

FOR YOUR

TRS-80 · PET · APPLE

GALACTIC BLOCKADE RUNNER—an exciting, different and sophisticated space war game with interesting graphic displays. Plays better than many of the Star Treks out there. T1/4 T2/16 P A \$9.95
SCI-FI GAME SAMPLER—includes 3 games—Space Monster, Lunar Lander and Space Battle, all with graphics. T1/4 T2/16 P \$5.95
SOLARIA—a sophisticated fantasy economic simulation—you won't believe the complexity of this one's output. T2/16 P \$9.95

PILOT— The educational language—Ready for your TRS-80! This version comes complete with a built in editor and 3 sample programs. Tape Version \$14.95 Disk Version \$24.95

DIET PLANNING PACKAGE—use your computer to help plan a safe, reliable diet—calculates what your weight should be, your daily calorie allowance—helps plan your menu. T1/4 T2/16 \$14.95
OTHELLO III—A strategy board game—play with the computer, a friend or have the computer play against itself. T1/4 T2/4 P A \$7.95
DAILY BIORHYTHM PROGRAM—has interesting moving line display, gives 30 day graph and more! T1/4 T2/4 \$5.95
MICRO-TEXT EDITOR—non destructable cursor, graphics capability, versital editing options, save & load screen, output to printer. T2/4 \$9.95

GIVE A VOICE AND EARS TO YOUR APPLE COMPUTER!

APPLE TALKER—speech synthesis for your APPLE computer! \$15.95
APPLE LISTENER—speech recognition for your APPLE computer. A nice companion program to the one above. Just think of the possibilities! \$19.95

MICROCHESS—play chess with your computer. Uses graphic display and provides various levels of difficulty. T1/4 T2/4 P A \$19.95

BRIDGE CHALLENGER—why wait to get 3 other people together to play? Your computer's ready anytime. T2/16 P A \$14.95

AIR RAID—a machine language, real time, arcade type game. Shoot down planes as they fly by. T1/4 T2/4 \$14.95

RSM-2—a machine language monitor for the TRS-80. Many, many features including a built in disassembler. \$26.95 Disk Version \$29.95

A NEW AND EXCITING VERSION OF STAR TREK IS ON THE WAY! WATCH OUR ADS FOR DETAILS OR SEND FOR FREE CATALOG.

APPLE 21—Black Jack for your APPLE! \$9.95

STAR WARS/SPACE MAZE—sci fi games for your APPLE. \$12.95

MICRO-TAX 78—just in time to help you prepare your returns. Does form 1040 and schedules A, B, C, SE, D & 4797. T2/16 \$12.95

RENUMBER—a machine language program for renumbering your BASIC programs, one of your most useful programming tools. T2/4 \$14.95

Hexadecimal
Address

4214 = 3 } number of responses;
4215 = 0 }
4216 = 1 } response record indices for
4217 = 2 } event.

The event processor will process the entries in the event record sequentially, extracting the response record index and activating RESPRO (the response record processor). Using this index the response processor will obtain RESREC (the indicated record from the response file) and direct the activation of the appropriate subprocessors, which contain the following information:

Byte 0 = response type {
0 = digital output;
1 = application module;
2 = delay activation;
3 = delay deactivation;
4 = time-of-day activation;
5 = time-of-day deactivation.

Bytes 1 and 2 = module address of record index.

For our example the records will be as follows:

Response File

Record 0 { Byte 0 = 2 } second delay
 { Byte 1 = 0 }
 { Byte 2 = 1 } timer record;
Record 1 { Byte 3 = 1 } address of annunciator
 { Byte 4 = 0F } application module;
 { Byte 5 = 2C }
Record 2 { Byte 6 = 0 } first digital output
 { Byte 7 = 0 } record.
 { Byte 8 = 0 }

The first record processed causes DELINT (the delay module) to activate the second record in TIMREC (the delay timer file). These records contain the delay time (in seconds) and address of the event record to be activated when the directed delay has timed out:

Delay Time Record

Bytes 0 and 1: active flag plus remaining time;
Bytes 2 and 3: number of seconds to delay;
Bytes 4 and 5: address of event record.

In our example this record (prior to activation) will appear as follows:

Bytes 0 and 1: 80, 0 = record inactive;
Bytes 2 and 3: 0, 3C = 60 second delay;
Bytes 4 and 5: 18, 42 = event record at hexadecimal 4218.

After the delay has been initiated, the event processor will notify the response processor to initiate the second response.

```

This time it determines that the response required from record 1 is to call the application module located at hexadecimal address 2C0F. This information is transmitted to APPL (the application task initiator subprocessor) by the response processor, which transfers control. In our particular example this application module will cause the display panel to flash the location of the sensor giving the alarm. Upon completion of this function the application module returns control to the event record processor.

Next, the event record processor transfers the index of response record 2 to the response processor. Recognizing that a digital output is to be initiated, the processor extracts the index of DIRREC (the digital output record), 0 in this example, and initiates DIGOUT (the digital output subprocessor).

The function of this subprocessor is to activate the audible alarm. A 3 byte record is used to effect the actual output:

Digital Output Record

Byte 0 = output port;
 Byte 1 = bit isolation mask;
 0 for reset (off);
 Byte 2 = 1 for set (on).

In our case let's assume that the audible alarm has been connected to bit 5 on output port 3 and must be set to a logic 1 to sound the alarm. This requires a digital output record as follows:

Audible Alarm Output Record

Byte 0 = 3;
 Byte 1 = 20;
 Byte 2 = 1.

Using this information bit 5 on output port 3 is set and the alarm horn is turned on. Processing this final response causes the event processor to return to the digital scan module, which will continue monitoring the state of all the digital inputs.

The intent of this example is to show how the system works when attached to the real world. While this example does not cover all the functions one might associate with a smoke or fire alarm, it does serve to illustrate how the various tables are structured. What you can do with such a system is limited only by your imagination. As stated earlier in this series, the system can be structured to perform many of the discrete tasks associated with the control and monitoring of the home or office, as well as protecting your property against intruders. So let your imagination take command and have fun. Next month: musical toys. ■

PET / TRS-80 / APPLE: Personal Software brings you the finest!

NEW! THE ELECTRIC PAINTBRUSH by Ken Anderson for 4K Level I and II TRS-80s: Create the most dazzling graphics displays you have ever seen with a minimum of effort. *The Electric Paintbrush* is actually a simple 'language' in which you can write 'programs' directing your paintbrush around the screen—drawing lines, turning corners, changing white to black, etc. Once defined, these programs may be called by other programs or repetitively executed, each time varying the parameters of brush movement.

The machine language interpreter executes your programs almost instantaneously, allowing you to create real-time, animated graphics displays. The screen photos above are actually 'snapshots' of the action of a single one-line program over about thirty seconds. Mesmerize your friends with visual effects they've never seen on a TV screen! There's no limit to the variety of exciting and artistic graphics displays you can create with *The Electric Paintbrush*. And it's available now for only \$14.95

MICROCHESS is the culmination of two years of chessplaying program development by Peter Jennings, author of the famous 1K byte chess program for the KIM-1. MICROCHESS 2.0 for 8K PETs and 16K APPLES, in 6502 machine language, offers 8 levels of play to suit everyone from the beginner learning chess to the serious player. It examines positions as many as 6 moves ahead, and includes a chess clock for tournament play. MICROCHESS 1.5 for

4K TRS-80s, in Z-80 machine language, offers 3 levels of play (both Level I and Level II versions are included and can be loaded on any TRS-80 without TBUG). MICROCHESS checks every move for legality and displays the current position on a graphic chessboard. You can play White or Black, set up and play from special board positions, or even watch the computer play against itself! Available now at a special introductory price of only \$19.95

BRIDGE CHALLENGER by George Duisman for 8K PETs, Level II 16K TRS-80s, and 16K APPLES: You and the dummy play 4 person Contract Bridge against the computer. The program will deal hands at random or according to your criterion for high card points. You can review tricks, swap sides or replay hands when the cards are known. No longer do you need 4 people to play! \$14.95

NEW! TIME TREK by Brad Templeton for 8K PETs is Personal Software's answer to the proliferation of Star Trek type games. This is a real time action battle game which requires fast thinking as well as sharp wits. There are no 'turns' in Time Trek: your scanners and ship's status report are constantly updated on the screen, and you can enter commands as fast as you can press the keys. You use your shields, phasers and photon torpedoes against enemy Klingons in a game where you can move, steer and fire at the same time. Star Trek aficionado or not, you'll appreciate the excitement and excellence of this real time game \$14.95

WHERE TO GET IT: Look for the *Personal Software™* display rack at your local computer store. Over 240 dealers now carry the *Personal Software™* line—more than any other brand. If your local dealer doesn't already carry *Personal Software™* products, ask him to call us at (617) 782-5932. Or you can order direct from us by check, money order or VISA/Master Charge. If you have questions, please call us at (617) 783-0694. If you know what you want and have your VISA/MC card ready, you can use any phone to

Using Warnier-Orr Diagrams

Editorial Note. . .

Since publishing David Higgins' first two articles on Warnier-Orr diagramming techniques, we have received a number of letters from people expressing the message (paraphrased) "if I have this or that self-documenting structured programming language, why should I use Warnier-Orr techniques? After all, if a program in my language is logically equivalent to the Warnier-Orr structure, and it is directly executable, I see no need for an extra layer of documentation."

A very real answer to this objection is that it is correct. There is no point to using Warnier-Orr techniques if you properly use a language such as PASCAL which, having structured programming constructs built in, allows long descriptive names for variables and procedures, and as a result can support self-documenting code.

But most currently used languages in personal computing do not easily support self-documenting code and modern concepts of structured programming. The usefulness of the Warnier-Orr methodology is that it provides a disciplined way of imposing such structure on a language such as BASIC, FORTRAN or assembly language. In effect, the Warnier-Orr discipline is a programming language which is intended for hand translation into one of the existing unstructured languages. . . CH

In my opinion, one of the best program and system design methods is the Warnier-Orr structured systems design approach, which I described previously ("Structured Program Design," page 146, October 1977 BYTE; "Structured Programming with Warnier-Orr Diagrams," page 104, December 1977 and page 122, January 1978 BYTE). This article is being presented because of the interest expressed in this subject, and because a lot of people will be trying these techniques for the first time. Newcomers to this methodology often have many questions about their work, and want to know whether or not what they are doing is correct. The purpose of this article is to outline a few of the more common mistakes that beginners make when using this technique.

Philosophical Errors

Many first time users of the Warnier-Orr diagrams tend to make mistakes which are so similar that they are worth examining. The

biggest and most common mistakes tend to be a direct result of what we can call philosophical errors; not really a misuse of the techniques so much as a misunderstanding of the techniques. The most common error stems from the fact that many computer programmers tend to be obsessed with the desire to write some kind of code at the very beginning of the design process. This problem usually manifests itself in any or all of the following three ways:

- Trying to code the program while designing it (called the design-a-little, code-a-little approach).
- Relying too heavily on language restrictions and considerations while doing logical design.
- Skipping the design phase altogether because:
 - a) the program is "too easy" or
 - b) the programmer is "too smart."

Any of the above practices will destroy most if not all of the effectiveness of the Warnier-Orr methodology [or any other structured programming methodology for that matter. . . CH]. It will certainly cause you to waste a great deal of time.

If you try to use the first technique, the design-a-little, code-a-little approach, you will probably be in for quite a bit of erasing or retyping when you have to change the design because you coded yourself into a corner that you can't design your way out of. Your program will tend to be twice as long as it should have been and half as efficient. You will probably be in for a lot of debugging runs while trying to put back into the code everything that you left out when you changed the design. As you can see, this technique just naturally generates problems.

The second technique described above is a common mistake that veteran programmers almost always seem to make: relying too heavily on the program language they will be using while doing the program design. Consider the two examples of program

The Software Company

Technical Systems Consultants, Inc.

TSC, Technical Systems Consultants, is the software company for all the newest, most innovative ideas in computer software. TSC builds a variety of programs, packages and games so you can get down to business or just some fun.

Text Editing System

The most complete and versatile editor available for the 6800 and 8080 micro. The system is line and content oriented for speed and efficiency and features such commands as block move and copy, append and overlay, as well as string manipulators. The 6800 version requires 5K beginning at 0 hex, the 8080 needs 6K starting at 1000 hex. Both should have additional file space as required.

SL68-24	6800 Text Editing System	\$23.50
SL68-24C	w/cassette	\$30.45
SL68-24P	w/paper tape	\$31.50
SL68-24D	w/mini flex disc	\$31.50
SL68-24F	w/flex disc	\$50.00

Specialists in Software & Hardware for Industry & the Hobbyist

Text Processing System

As a complement to the Editor, the Processor supports over 50 commands for left, right or center justification, titling, paging and general text output formatting. A loop command is available for repeated formatting jobs such as form letters. Also included are capabilities for macro definition to build special formatting commands. The program requires about 8K of RAM and previously edited text.

SL68-29	6800 Text Processor	\$32.00
SL68-29C	w/cassette	\$38.95
SL68-29P	w/paper tape	\$40.00
SL68-29D	w/mini flex disc	\$40.00
SL68-29F	w/flex disc	\$75.00
SL80-11	8080 Text Processor	\$32.00
SL80-11P	w/paper tape	\$41.00
SL80-11F	w/ CP/M disc	\$50.00

Relocator

This self-prompting, easy to use program relocates object code in RAM or from tape. Complete instructions included for making the TSC Editor and Assembler or Editor and Text Processor co-resident. (As sold they reside in the same area.) Just over 1K in length.

SL68-28	6800 Relocator	\$ 8.00
SL68-28C	w/cassette	\$14.95
SL80-13	8080 Relocator	\$ 8.00
SL80-13P	w/paper tape	\$13.00

The Mnemonic Assembler

The ideal addition to the Text Editing System, together they form a complete program development center. The Assembler is one of the most versatile available and allows for easy adaptation to most systems. The Assembler is many times faster than other resident assemblers. Requires approximately 5.5K plus file and symbol table space.

SL68-26	6800 Mnemonic Assembler	\$23.50
SL68-26C	w/cassette	\$30.45
SL68-26P	w/paper tape	\$31.50
SL68-26D	w/mini flex disc	\$31.50
SL68-26F	w/flex disc	\$50.00
SL80-12	8080 Mnemonic Assembler	\$25.00
SL80-12P	w/paper tape	\$34.00
SL80-12F	w/ CP/M disc	\$40.00

All programs include complete source listing. Cassettes are in the Kansas City standard format.

All orders should include check or money order. Add 3% for postage and for orders under \$10, please add \$1 for handling. Send 25¢ for a complete software catalog.

Figure 1: DOs and DON'Ts of Warnier-Orr diagramming. Figure 1a looks like actual program code and should not be used when trying to logically design a program. Figure 1b shows the correct method. The entire diagram contains only logical statements which could be coded into any computer language.

designs shown in figure 1. Both figures 1a and 1b are diagrams of the same process: computation of overtime wages. The diagram in figure 1a however seems to be the type that veteran programmers will almost always try to draw. Note its heavy stress on the language aspect of the function. It almost looks like part of a BASIC program cut out and pasted on a diagram. Contrast that diagram with the one of figure 1b which correctly details the logical process being performed. You can see that if figure 1a was the only documentation for this particular procedure, you would probably not be able to tell what that piece of code was supposed to be doing. You might have some idea because this program seems to have semimeaningful field names from which you might deduce some purpose. All we can tell for sure from figure 1a is that some part of the program is going to crunch a couple of numbers. What numbers it is going to crunch and just what for are anyone's guess. On the other hand, it is impossible to misunderstand what the process diagrammed in figure 1b is doing. It is very easy to read and comprehend because it shows the logical side of the procedure.

This stress of the logical over the physical while designing with the Warnier-Orr diagrams is essential to their correct usage. Designing as in figure 1a serves absolutely no purpose as far as understanding the process that is being described and is essentially worthless as far as documentation is concerned. Even though you might be able to tell what that diagram does the day you draw it, you probably won't be able to understand it in six months. Someone else who wants to use your documentation might never understand it.

As long as we're on the subject of docu-

Figure 2: Typical productivity curve of programmer being introduced to Warnier-Orr diagram methodology.

mentation, I might mention that through the development period of this technique, many people were concerned that the diagrams might become too far removed from the actual code, which would render them useless as effective documentation. They worried that since the diagrams depicted the logical side of the problem, they had little or no relevance to the physical (real world) side. Those fears were easily put aside with two diagramming and coding conventions, as follows:

- Physical mileposts on the Warnier-Orr diagrams.
- Logical symbol tables in the programs.

Thus, when we actually wrote code that looked like that of figure 1a, we would tie it to the logical figure 1b by adding the following to the diagram.

This would be included in the program itself by using comment statements:

```

1000 REM      COMPUTE OVERTIME PAY
1001 REM      HFLD   = HOURS WORKED
1002 REM      OVTFLD = OVERTIME PAY
1003 REM      SALFLD = SALARY

```

This allows us to have a very clear and concise, one to one mapping between the logical diagram and the physical code. References between the two diagrams are quite easy. If, for instance, you want to know what a particular section of code is supposed to be doing, you need only to look it up on the logical diagram. Similarly, if you want to find out which part of the program is carrying out a particular logical function, you have the location information at your fingertips. This is excellent documentation in the event that you or someone else might someday want to make a modification to your code.

The third common philosophical error, that of skipping the design phase altogether, is a real problem to most newcomers. In fact, if you look at a typical productivity curve for a programmer who is introduced to the Warnier-Orr diagrams, it generally looks something like the curve in figure 2.

A currently productive programmer producing work at a constant rate up until the time the Warnier-Orr techniques are introduced (point A), will typically show an initial burst of very high productivity (point B). This is usually followed by a slump (point C) where the programmer sinks back to or just above his previous level of work. Eventually, he will climb back up to a new, higher level of work (point D), where he will usually stay. This peculiar slump at point C seems to be primarily due to the fact that since the programmer has begun to feel comfortable with the new technique and has had some initial success with it, he begins to feel confident enough to try to do the work without doing the diagrams first. He soon realizes that the quality of his work has dropped off and starts to do the diagrams once again, this time for good, and his work level rises up to a new, higher level that will remain fairly constant.

Apparently, the only way to get new people to avoid this temptation is to forewarn them that it does tend to happen, so that if and when they find themselves on the downhill side of the productivity curve, they can recognize the trap in time to escape the worst of it.

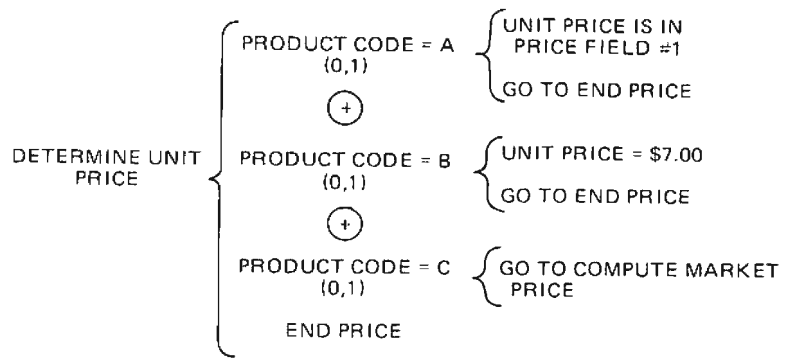

Figure 3: Example case statements making use of logically illegal GOTO statements. When a set of statements is finished the diagram will logically fall through all of the other exclusive ORs, ⊕, and arrive at the END PRICE section. Thus no GOTO need be shown.

So much for the philosophical errors. There are also a few common technical errors that people make, and we'll look at those next.

Technical Errors

For a lot of people who are just starting to program and may be unfamiliar with structured programming techniques, some of the diagramming methods may seem to be a bit uncomfortable. One of the most often seen technical errors is the attempted use of a GOTO statement on the diagram. The case statement shown in figure 3 illustrates this problem.

Two of the occurrences of the GOTOs in figure 3 are incorrect and the other is ambiguous. The GOTOs in "PRODUCT CODE = A" and in "PRODUCT CODE = B" are unnecessary and incorrect. The default logical linkages will see to it that the appropriate steps are executed. The GOTO at "PRODUCT CODE = C" is unclear. If it is supposed to mean that we are to cease execution of this process and jump to the procedure "COMPUTE MARKET PRICE" to begin processing, then its usage is incorrect. If on the other hand it means that "COMPUTE MARKET PRICE" is a common utility routine and is described elsewhere in the system, then the GOTO is misleading. Instead, we should have written:

```

PRODUCT CODE = C { COMPUTE MARKET PRICE
(0,1)             ... SEE PAGE #3,

```

if the process was expanded on a different page of the diagram; or something like the words "...SEE ABOVE" or "...SEE BELOW" if that process appears elsewhere on the same page. The GOTO is a physical entity to be used at execution and is not a logical relationship, so it does not belong on

Figure 4: Example of a case statement with processes that are mutually exclusive and mutually independent.

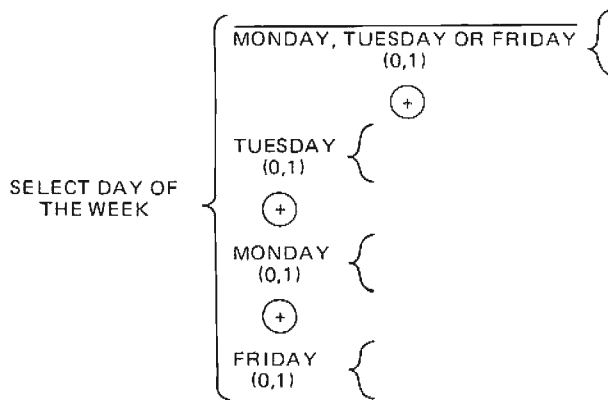

Figure 5: When a case statement has mutually independent and mutually exclusive statements, the statements may be rearranged into any order without changing the logic of the diagram.

Figure 6: Although this is a working Warnier-Orr diagram, the case statements are not mutually independent.

```

IF 'player has no body'
  THEN ...
ELSE IF 'player has no neck'
  THEN ...
ELSE IF 'player has no head'
  THEN ...
ELSE IF 'player has two antennae'
  THEN ...
ELSE 'give player one antenna'

```

Listing 1: Typical if-then-else structure for Warnier-Orr diagram of figure 6.

a logical Warnier-Orr diagram.

Another common technical mistake is one that is a little harder to catch, and is one that even professionals with this technique will make if they aren't careful. Consider the case statement shown in figure 4.

Note that in this case statement, not only are the processes outlined mutually exclusive (only one of the cases is true), but they are also mutually independent. That is, their order within the case statement does not matter. It would be just as correct for me to have written the diagram as shown in figure 5.

In an earlier article "Structured Program Design" (Oct 77 BYTE), the game of BUG was outlined. In the game, a die is rolled for each player and each number of the die corresponds to a part of the bug's body; the player finishing his bug first wins the game. If a player rolls a 4 for instance, he is entitled to one antenna. But he must have already acquired a body, a neck and a head in that order before he can receive an antenna. He needs a total of two antennae if he is to complete a bug.

Many people would try to code that process as a case statement as in figure 6. The process in figure 6 certainly looks correct, and indeed, if you code it as a case statement, as in listing 1, it will even run correctly.

However, this process is not a case statement. It is more properly called a pseudo-case statement, because each of its cases is mutually dependent. The cases cannot be reordered within the statement without destroying its logic. Notice that rearrangement of the case statement diagram as shown in figure 7 does not work at all. This arrangement will give the player an antenna anytime a four is rolled, until he has two antennae, regardless of whether or not he already has a body, a neck or a head. A more correct logical interpretation of the case structure we want is shown in figure 8.

You might also notice that since the bug must have a body before it can have a neck (and a neck before it can have a head) if we

S-100 Memory for peanuts, Artec has slashed its prices!

32K for \$620, 16K for \$315—Assembled.

No matter what your needs, Artec has a memory board for you. You can start with 8K of TI 4044 memory on a 5.3" x 10" card and work your way up to a full 32K in 8K increments. The access time is only 250ns. The memory is addressable in 4K blocks and is perfect for S100 and battery augmented systems. The Artec 32K Expandable Memory has four regulator positions, bank select and plenty of room for all necessary support hardware. It uses less than 1 amp per 8K of memory (3.9 for 32K), and only +8 volts.

BOARD	KIT	ASSEMBLED
8K Memory	\$150	\$175
16K Memory	\$265	\$315
24K Memory	\$400	\$475
32K Memory	\$520	\$620

Add-ons: \$135—Chips alone: \$7.00

GP100—\$20.00

Maximum design versatility along with standard address decoding and buffering for S100 systems. Room for 32 uncommitted 16 pin IC's, 5 bus buffer & decoding chips, 1 DIP address select switch, a 5 volt regulator and more. High quality FR4 epoxy. All holes plated through. Reflowed solder circuitry.

WW100—\$20.00

A wire wrap breadboard, similar to the GP100. Allows wire wrap of all sizes of sockets in any combination. An extra regulator position for multiple voltage applications. Contact finger pads arranged for easy pin insertion.

Buffering Kit—\$12.65

All the necessary components to bootstrap any Artec board into your system. Buffering I/O, DIP switch heat sinks and every support chip you need.

TO ORDER: Use your Mastercharge or BankAmericard. Or just send along a money order. We can accept only U.S. currency. Please include \$3 handling on all orders. California residents add 6.0% sales tax.

FOR MORE INFORMATION: For more information about these or any of Artec's complete line of circuit boards or for either industrial or personal use, please call or write. A catalog will gladly be sent.

Please send me: (Include Quantity)

32K GP100 WW100

I've enclosed a money order.

(415) 592-2740

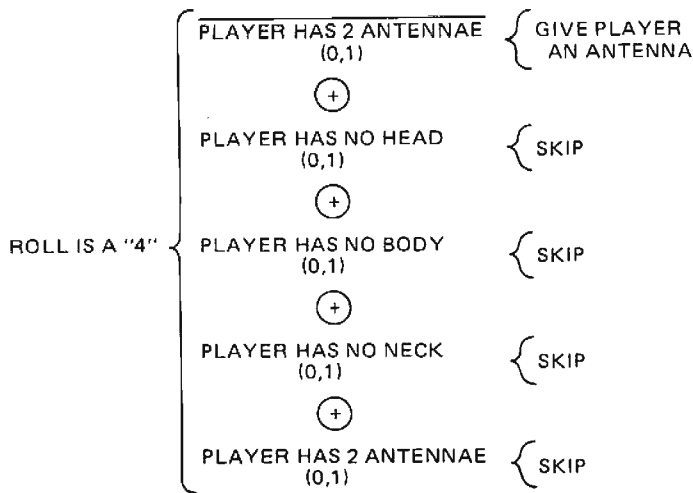

Figure 7: When the statements in figure 6 are rearranged as shown, it can be seen that the program fails to work as desired.

merely check for the presence of the head, we will be indirectly checking for the neck and the body, so that figure 9 is an equivalent structure.

Another common technical error is the misuse or lack of use of the (0,1) notation in conjunction with the exclusive OR, \oplus . Many times, people will simply write:

By this they often imply the (0,1) notation with the use of the symbol \oplus alone. Actually, this is not incorrect; in fact, for most people familiar with the diagrams, this notation seems to be just as clear. But for users not quite familiar with the Warnier-Orr diagrams it is probably best to go ahead and include the (0,1).

To conclude, I'll reiterate a point made in an earlier article: Understanding a Warnier-Orr diagram is very easy; creating one from scratch is much harder than it looks. ■

Figure 8: This method of approaching the stated "bug" problem is more logically correct than that of figure 6. All of the statements at each level of the diagram are mutually exclusive and mutually independent.

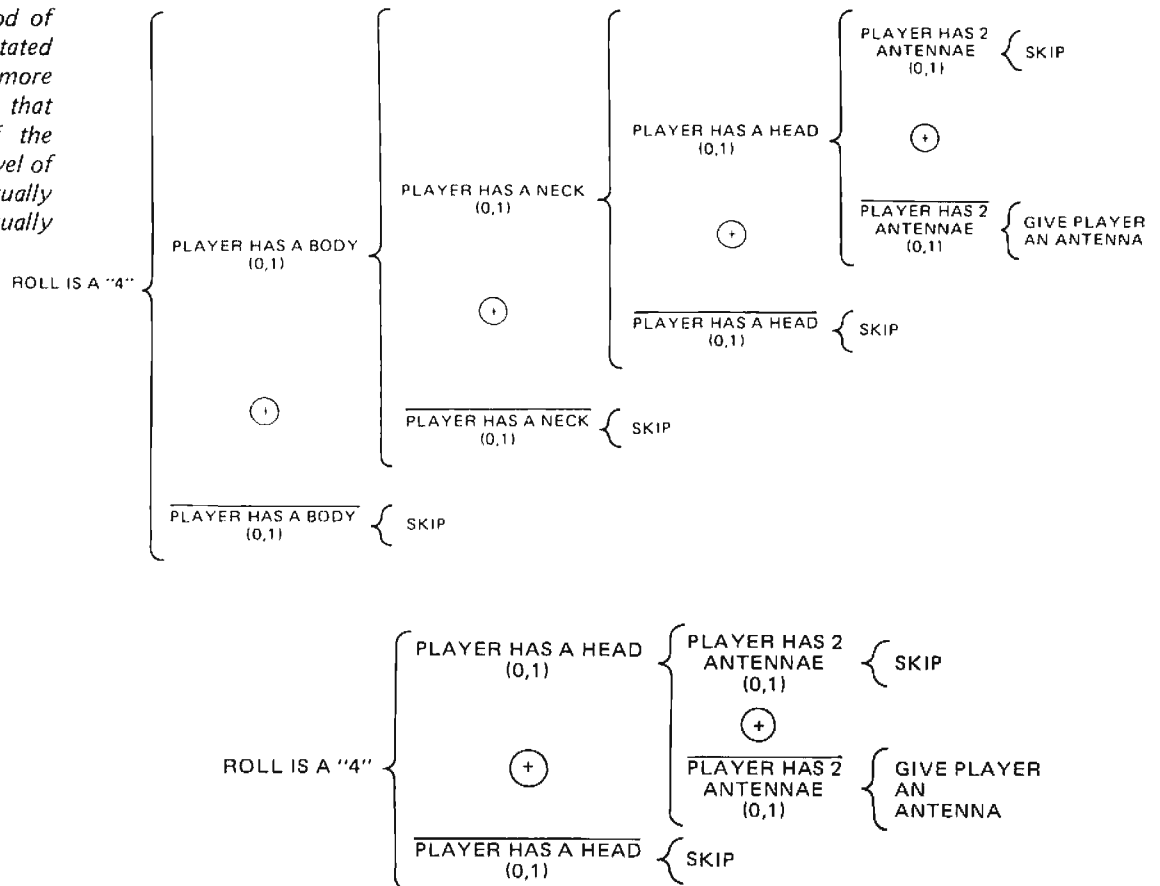

Figure 9: Since a bug must have a head in order to have an antenna, and a body and neck to have a head, the search process can be shortened by just checking for the presence of a head.

IT'S NOT A TELEPHONE...

THE SUPERPHONE®

The telephone with such sophisticated features it's more than a phone. An indispensable desktop aid or bedside friend, with microprocessor controlled solid state electronics and 14 digit LED readout. Here's what Superphone does for you:

It's a Telephone

- Easily connects to any private or business phone line... and there's no need to switch to Touchtone® service because Superphone works on either Touchtone® or rotary dial lines with ultimate pushbutton convenience.
- Simply lift the hand set and you're in the telephone mode.
- Even if there's a power failure, the rechargeable battery takes super charge of the situation.

It's a Memory-dialer

- Superphone enables you to store the 20 numbers you call most frequently, and these numbers can be up to 14 digits long.
- Just press the MEM DIAL and the location number and your number will be both displayed and dialed automatically.
- For PBX users who need to dial an "access" number (such as "9") for an outside line, it provides a pause before the next digit is dialed.

It's an Auto-redialer

- Automatically stores the last number dialed whether from memory or manually.
- Just press REDIAL and the last dialed number will be displayed and dialed automatically.

It's a Calculator

- Four-function floating decimal point, eight digit calculator: +, -, ×, ÷, and chain calculations are features that count.
- Calculations without interference, even during a conversation.
- Just press CALCULATOR key to start or to terminate calculator functions.

It's a Digital Clock

- Constant display of hour, minute, day, and date keeps you in time with a blinking dot per second.
- Quartz crystal accuracy for super dependability.
- Easy Keyboard programming for the time and date set.

It's an Alarm Clock

- Alarm can be set to the minute to keep you on schedule.
- The buzz will remind you of important appointments or wake you up when you want.
- Easy Keyboard programming for the alarm time set.

It's a Stopwatch

- Enables you to clock your conversations to the second.
- Just press the TIMER key to start the stopwatch function.

It's Guaranteed

- Built-in battery that continues phone function in event of power failure.
- One year warranty.
- FCC approved for direct connection to all phone lines.
- Complete money back guarantee if returned within 30 days.

Available in Ivory (with black faceplate) or Espresso Brown (with chocolate brown faceplate). Each \$229.00 plus \$2.50 insured UPS shipping and handling.

Offers The Best In Software for your Microcomputer...

MICROCHESS - by Peter Jennings - from Personal SoftwareTM

Peter Jennings has been pioneering computer chess programs for the personal microcomputer, and MICROCHESS is the mature fruition of two years of this development. With several levels of play it will sharpen your game and prove to be a challenging opponent.

MICROCHESS 1.5 - for 4K TRS-80's

This is a 4K Z-80 machine language program utilizing every byte of available memory on the TRS-80. It displays a graphic chessboard and even flashes the piece on which the computer narrows its attention prior to making its move. Based on earlier chess programs for the 8080 and 6502 microprocessors, Microchess incorporates the improvements suggested by hundreds of users, and offers three levels of play to challenge all players from beginners to real chess enthusiasts.

Microchess can be fun on any TRS-80 and is easily loaded from cassette with the CLOAD command. Standard algebraic notation is used to describe the moves, and a simple command lets you temporarily number the squares to assist in move entry. Every move is checked for legality, and the program even handles castling and en passant captures. You can play white or black, set up special board situations and play them out against the computer, or even watch the computer play against itself.

MICROCHESS 2.0 - for 8K PET's and 16K Apples

In 6502 machine language, this version of Microchess offers eight levels of play to suit everyone from beginner to the serious player. It examines positions as many as six moves ahead, and includes a chess clock for tournament play. \$19.95 each.
TRS-80 (4K) PET (8K) Apple (16K)

BRIDGE CHALLENGER - by George Duisman - from Personal SoftwareTM

If you like to play bridge but have trouble getting four people together to play, or if you'd just like to practice a little to improve your play, this program cassette is for you. With Bridge Challenger you and the dummy play against the computer in regular contract bridge. You can let the computer deal, or set up hands for study and practice play and save them on cassette. Created by George Duisman, an expert bridge player and programmer, this program takes full advantage of the PET's BASIC and requires all of the 8K RAM to run. Standard bridge notation, like that found in books and newspaper columns, is used to help you analyze the hands. Complete instructions, including an introduction to bridge for the novice, are included in six pages of documentation. \$14.95 each.

TRS-80 (16K Level II) Pet (8K)
Apple (16K)

STIMULATING SIMULATIONS - by Dr. C. William Engel - from Personal SoftwareTM

This is a set of ten original simulation games written by Dr. Engel. The games are fun, and the 64 page paperback book which accompanies the cassette giving instructions, flowcharts, program listings and suggested modifications makes Stimulating Simulations an educational tool too. The games begin on an elementary level and progress to more complex problem situations, but most can be played by schoolchildren. The program listings in the book are in PET or TRS-80 Level II BASIC but special versions of the programs are provided for Level I BASIC users. \$14.95 each.

TRS-80

PET

...now!

GRAPHICS PACKAGE - from Personal SoftwareTM

This set of four programs provides a quick and easy way for you to use your PET for several of the most common graphics applications: plotting equations or data, drawing pictures, and creating headlines of block letters. These programs, written by Dr. Peter Maggs, make use of the PET's graphic capabilities and can provide another dimension in your personal computing. \$14.95
PET

ASSEMBLER IN BASIC - from Personal SoftwareTM

Now you can write programs in assembly language for the 6502 microprocessor and have them translated to machine language for direct execution on your PET. The assembler accepts all standard 6502 mnemonics, pseudo-ops and addressing modes plus a new TEXT pseudo-op, and evaluates binary, octal, decimal, hexadecimal and character constants, symbols and expressions. You can create assembly source programs with the text editor which is supplied, and save

them on cassette. The assembler reads its source code from cassette or from DATA statements, and assembles machine code directly at any location in memory. You can save machine language subroutines in the PET's second cassette, buffer, and execute them immediately with keyboard and display input/output. \$24.95
PET

ASTROLOGY PROGRAMS - by Michael Erlewine - from Personal SoftwareTM

You enter the date, time, and place of your birth. The program computes the sidereal time on the equator of your birth and your ascendant or rising sign, midheaven, and vertex angles in degrees / sign of zodiac / minutes of arc format. The helio and geocentric planetary positions are also given, and the program will optionally calculate and display the Local Space positions of the planets, the Local Space chart for a locality shift, give the position and direction in azimuth along the horizon of any city in the world, or display the equatorial coordinates for your natal planets. You can even input the right ascension and declination of any celestial object, and the program will compute its position on the horizon or Local Space chart. This program is loaded with celestial mechanics equations, and will save you or your astrologer hours of calculating time. \$14.95

PET

SARGON - A COMPUTER CHESS PROGRAM - by Dan and Kathe Spracklen - from Hayden

SARGON is the computer chess program that won the 78 West Coast Computer Faire tournament for microcomputers. Now you can run it on your own TRS-80 Level II. It is available in two forms: the book which contains the program listing in Z-80 assembly language and enough documentation to enable you to tailor and run it on your 8K Z-80 machine, and in cassette form ready to run on any TRS-80 Level II. Test your skill in this classic game; the machines are getting better!

Sargon Book with listing \$14.95
Cassette for TRS-80 Level II
(with brief instruction booklet) \$19.95

Practical Microcomputer Programming

PRACTICAL MICROCOMPUTER PROGRAMMING: THE INTEL 8080 by W J Weller, A V Shatzel, and H Y Nice.

Here is a comprehensive source of programming information for the present or prospective user of the 8080 microcomputer, including moving data, binary arithmetic operations, multiplication and division, use of the stack pointer, subroutines, arrays and tables, conversions, decimal arithmetic, various IO options, real time clocks and interrupt driven processes, and debugging techniques.

This 306 page hardcover book is well worth its \$21.95 price and should be in every 8080 or Z-80 user's library.

PRACTICAL MICROCOMPUTER PROGRAMMING: THE M6800 by W J Weller.

This second volume of the Practical Microcomputer Programming series addresses the problems of applications programming at assembly level for the M6800. In 16 chapters and more than 100 formal examples, the fundamental techniques of assembly level programming are applied to the solution of specific problems with the 6800. Nowhere theoretical, it is a thorough and detailed methods text for the beginning and intermediate application programmer using the 6800. Hardback. \$21.95.

THE TELETYPE MODEL 43 FAMILY.

Naturally, a company whose name has almost become synonymous with data communication in industry can produce exceptionally fine business terminals. These terminals, just as naturally, form the best business end for your personal computer. When you're ready for your computer to start earning its keep, let us put a system together for you. We offer a complete line of Teletype Corporation Products interfaced and tested to Apple II, TRS 80, Commodore Pet, Amsai, Ohio Scientific and others. We stock and distribute this specialized product line and our goal is to provide you with the best service, the best delivery, and the best price available anywhere.

The following printers are available now. Many more soon.

DELUXE BUSINESS MODEL 43, 132 Column Pin Feed \$1295.00
 80 COLUMN MODEL 40, 300 Line Per Minute Work Horse \$2395.00
 132 COLUMN MODEL 40, 300 Line Per Minute Industry Standard \$3500.00

INTRODUCING DUAL DRIVE MINIFLOPPY FOR PET!

DEALER
INQUIRIES
INVITED

DKH641 IS A PRODUCT OF COMPUTHINK.

- *DUAL MINI FLOPPY DRIVE WITH 100K PER DISK SIDE FOR TOTAL 200K ON LINE.
- *DESIGNED FOR COMMERCIAL SPEED REQUIREMENTS *FAST LOADING SPEED.
- *DISKMONTM™ (DOS) AUTOMATICALLY REORGANIZES FREE DISK SPACE AFTER SAVE OR ERASE.
- *DISKMON IS RESIDENT IN ROM VIA DISK CONTROLLER BOARD PLUGGED INTO EXPANDAPET.*
- *DISKMON ADDS 16 COMMANDS TO BASIC INCLUDING DISK DATA FILES.
- *DISKMON COMMANDS SUPPORT COMMERCIAL PRINTER OFF PARALLEL PORT SUCH AS CENTRONICS 779.
- *FULL DISK SOFTWARE SUPPORT * FORTRAN & PLM COMPILERS THIS JANUARY.
- *90 DAY MANUFACTURER'S WARRANTY ON HARDWARE*READY TO USE ON DELIVERY. WITH FULL INSTRUCTIONS AND UTILITY DISKETTE.
- *CALL OR WRITE FOR ADDITIONAL INFORMATION * INITIAL QUANTITIES LIMITED.
- *THIS SYSTEM IS FULLY SUPPORTED BY SOFTWARE FROM THE MANUFACTURER.
- *ORDERS ARE NOW BEING ACCEPTED FOR DECEMBER & JANUARY DELIVERY.

DKH642	—DUAL DRIVE SYSTEM, COMPLETE WITH DISKMON	\$1295.00
DKL067	—DISKMON ASSEMBLER LISTING/DOS	\$19.95
ASM789T	—PET ASSEMBLER ON CASSETTE	\$19.95
ASM789D	—PET ASSEMBLER ON DISKETTE (5.5 inch)	\$49.95
LNK456	—AUTOLINK LINKING LOADER ON DISKETTE	\$49.95
FOR300	—FORTRAN COMPILER ON DISKETTE (JAN'79)	\$69.95
PLM400	—PLM COMPILER ON DISKETTE (JAN'79)	\$49.95

*** BUSINESS PACKAGES STARTING IN 1st QUARTER 1979 ***

A Search for Vector Graphics

Mitchell Gilberg
c/o Coles, POB 610
Natchez MS 39120

I am a subscriber and avid reader of BYTE, and I have a problem I hope you can help me solve. I am trying to find some information on a particular type of video graphic display and whether it is currently available on any personal computers. Unfortunately, I don't know a technical name, so I'll have to attempt a cumbersome non-technical description. What I want is to be able to draw one dimensional lines between defined endpoints, and to move the lines continuously across the screen.

Let me give you an example. Suppose an application I want to display is an aircraft instrument panel. The altimeter might look something as shown in figure 1. With the relatively common raster scan grid the altimeter would look as shown in figure 2.

One problem here is that in order to have enough detail to read the instruments, they would have to be too big to get an entire instrument panel on the screen. Another is that "lines" are not continuous. They are approximations that frequently lose their original shape when rotated between horizontal and vertical. Also, small displacements are lost if they aren't large enough to cause a quantum jump between plot grid points.

With high density noncolor graphics, you gain the ability to create a more detailed drawing, but motion becomes impractical. To show increasing altitude on the altimeter above, you must calculate a new location for each point on the rotating indicator and set and reset the corresponding bits in memory. That might represent several hundred calculations for each degree of rotation. Also, the indicator will not move as a unit. That is, it "warps" point by point, as shown in figure 3.

Figure 3.

In the past, I have used a Tektronix 4010 storage tube. This particular device allows plotting graphics as lines between endpoints. That is, your program specifies a starting and ending point for a line segment, and you can then "draw" a line between the points. So, for rotation of the altimeter, you need only calculate the positions of three points, and connect them with line segments. The line segments are always continuous, never warped. However, the Tektronix stores the line until the entire screen is erased, so you can draw detailed diagrams although true motion is impossible. You must erase the entire screen and redraw it at the new position—a process which takes several seconds for complex diagrams.

Let me now try to describe what I need. The display must be able to define lines as the Tektronix does, so that line movements are done by simply recalculating the endpoint locations. But, it must also allow for moving the line without having to recreate the entire drawing— or, if it must recreate the entire drawing, it must recreate it fast enough so that you don't see an erase and redraw action. (I have seen this type of display in only two places, both of which were in 25 cent video arcade games, and both of which were a Space War game. The games were similar in that they both showed spaceships which moved continuously through space, able to turn through any angle.)

If you or any of your readers can tell me who makes this type of display, or how it works, or if it's even feasible to do with personal computers that are available today, I would certainly appreciate it. ■

Figure 1.

Figure 2.

We cannot help specifically in this reply, but can point you in the right direction: you are looking for a vector display, where an XY oscilloscope with blanking is driven from a list of XYZ coordinate triples. (The Z axis simply indicates an intensity for the line of 0 or 1.) An example of this was found in Steve Ciarciá's article, "Make Your Next Peripheral a Real Eye Opener," (November 1976 BYTE, page 78). Steve's design is not, to our knowledge, currently being manufactured, so you will have to build it yourself. . . .CH

C-10000

THE FIRST TV CAMERA DESIGNED FOR COMPUTER INTERFACE

SUPERB RESOLUTION—

Observe minute detail with resolution over 1000 TV lines.

VIRTUALLY DISTORTION-FREE—

Image is accurate, linear from center of screen to outer edge with less than 0.2% distortion.

STABLE—

Less than 0.05% drift per 24 hours, less than 0.2% from 10° C to 40° C.

PLUS ALL LINES NEEDED FOR DIGITAL AND ANALOG COMPUTER INTERFACE

Filling 6800 Op Code Holes

Table 1: A table of "holes" in the 6800 op code space. Analyzing the holes involves tabulating the effect of each instruction on the condition code register, computing the number of machine cycles for each instruction, and most importantly, finding suitable applications for these instructions.

Instruction Length	Hex Code	Label	Commentary
1	00	NOP	
1	02	NOP	
1	03	NOP	
1	04	NOP	
1	05	NOP	
1	12	SBA-1	A←A - (B+1).
1	13	SBA-1	Same as 12.
1	14	NBA	A←A AND B
1	15	NOP	
1	18	DAA	No effect on carry bit?
1	1A	ABA	No effect on carry bit.
1	1C	ABA+1	A←A + (B+1). No effect on carry or half-carry bits.
1	1D	ABA	A←A + B. No effect on half-carry bit.
1	1E	TBA	Same as 17.
1	1F	TBA	Same as 17, plus carry bit is set to 1.
2	21	BRA r	Same as 20.

When looking at a reference chart for the Motorola 6800 processor, one may notice many nonimplemented op codes. It is possible that these codes, when properly explored, can lead to interesting operations of the processor. I could not resist the challenge to do this and have spent many frustrating hours trying to understand the strange results obtained. By dint of perseverance, I eventually worked my way through every one, producing table 1. I have not yet made a study of the complete effect of each operation on the condition code register, although some were obvious along the way.

It is interesting to note that four of the op codes (hexadecimal 87, 8F, C7 and CF) actually modify the program, conveniently skipping one program step in the process. This jumped over step could contain a branch or jump instruction, so that if the modified part of the program is immediately followed by a branch back to the skipped over instruction we would have the possibility of an approximately 65,536-way branch, depending on the result of some calculation in either of the accumulators or the index register. Of course, any program using this self-modifying feature can only be implemented in programmable memory. Committing it to read only memory would automatically render it unchangeable.

Three codes (hexadecimal 3D, 9D and DD) cause the 6800 to continuously increment the address bus with both the valid memory address (VMA) and read write (RW) lines held high, but the microprocessor does not act on the instructions it reads along its route. Perhaps they can be used in the form of some direct memory access instruction with a hardware halt to the process by activating RESET.

It would be interesting to find out if all 6800s follow the patterns in my table, or if the results are specific to my individual unit. Remember, these instructions worked in my processor but may not necessarily work in yours. The best course of action is to use my table as a base and then double check your own processor.

ENCOUNTER of the 6800 kind...

The Personal Machine from JF

Introducing the JF88. A Computer System that's both affordable and expandable. The JF88 is finding widespread use in hobbyist, small business, and OEM applications. Its expandability and low cost will make it the affordable solution to your every processing problem. You can order it the way you like it. Either in KIT Form for \$549.95, or fully assembled and tested for \$749.95. At these prices, shouldn't our computer be solving that problem instead of you?

FEATURES

- Woodgrain Cabinet
- SS50 Based System
- Cassette I/O Included
- Serial Communications to 9600 BAUD
- MIKBUG Compatible
- 16 Slot Motherboard
- 2K ROM Monitor on CPU

Let's Be PALs:

Some Comments on

BBC Teletext

R G Silson
Near Station
TRING
Herts HP23 5QX
ENGLAND

E John Dehaven (April 1978 BYTE, page 152) is a little out of date regarding British TV standards. In 1936 the world's first high definition television station started regular broadcasts from Alexandra Palace, London ENGLAND. The transmission used 405 lines with AM sound and synchronized to the 50 Hz power lines. After the war the system was extended to cover the whole country on VHF.

With the introduction of color, a new UHF network was set up which now has around 1000 transmitters. The color system uses a 625 line phase alternation line (PAL) system with FM sound. *[In the PAL color system, the subcarrier derived from the color burst is phase inverted from one line to the next to minimize possible transmission hue errors. . .CM]* No new 405 sets have been available for many years. Official policy has been to delete the 405 line system

as soon as practical since all channels are duplicated on UHF. The problem is that many small communities in hilly areas find UHF reception very poor and a local UHF transmitter is not always economic.

In Britain the whole 50 Hz power system is synchronized by high voltage links, but transmitters are no longer tied to it. This change is perhaps unfortunate since some sets show a moving band, at the difference frequency, up or down the screen. This is usually faint but noticeable to the critical.

There is no need to modify the latest British color sets. They include high quality video display unit facilities to receive the new Teletext transmissions. All 625 channels now transmit digital data on unused picture lines giving up to 800 pages on each channel (more with special arrangements as below). A standard format of 24 lines, each with 40 characters, is used, with odd parity 8 bit bytes for each character. Each page is numbered (100 to 899) and the whole series is transmitted in sequence each 15 seconds or so. Some pages (eg: page 100) give general or special indexes to other pages which carry all kinds of information from news to recipes, sports to weather maps, etc. A digital

the electric pencil II™

© 1978 Michael Shrayer

The Electric Pencil II is a Character Oriented Word Processing System. This means that text is entered as a string of continuous characters and is manipulated as such. This allows the user enormous freedom and ease in the movement and handling of text. Since line endings are never delineated, any number of characters, words, lines or paragraphs may be inserted or deleted anywhere in the text. The entirety of the text shifts and opens up or closes as needed in full view of the user. The typing of carriage returns as well as word hyphenation is not required since lines of text are formatted automatically.

As text is typed in and the end of a screen line is reached, a partially completed word is shifted to the beginning of the following line. Whenever text is inserted or deleted, existing text is pushed down or pulled up in a wrap around fashion. Everything appears on the video display screen as it occurs which eliminates any guesswork. Text may be reviewed at will by variable speed scrolling both in the forward and reverse directions. By using the search or the search and replace function, any string of characters may be located and/or replaced with any other string of characters as desired.

When text is printed, The Electric Pencil II automatically inserts carriage returns where they are needed. Numerous combinations of line length, page length, line spacing and page spacing allow for any form to be handled. Character spacing, **BOLD FACE**, multicolumn as well as bidirectional printing are included in the Diablo versions. Right justification gives right-hand margins that are even. Pages may be numbered as well as titled. This entire page (excepting the large titles and logo) was printed by the Diablo version of The Electric Pencil II in one pass.

Now on CP/M

The Electric Pencil II is also compatible with Imsai's **IMDOS**. **HELIOS** versions **SSH** and **DSH** are now ready. The **NEC** print package is now available. A utility program that converts **PENCIL** to **CP/M** to **PENCIL** files is ready. "**CONVERT**" is only **\$35.00**.

NEW FEATURES: * **CP/M, IMDOS and HELIOS** Compatible * Supports **Four Disk Drives** * **Dynamic Print Formatting** * **DIABLO** as well as **NEC** printer packages * **Multicolumn Printing** * **Print Value Chaining** * **Page-at-a-time Scrolling** * **New Bidirectional Multispeed Scrolling Controls** * **New Subsystem with Print Value Scoreboard** * **Automatic Word and Record Number Tally** * **Cassette backup for additional storage** * **Full Margin Control** * **End-of-Page Control** * **Non-Printing Text Commenting** * **Line and Paragraph Indentation** * **Centering** * **Underlining** * **BOLD FACE** *

W I D E S C R E E N V I D E O ! ! !

Available to Imsai V10 video users for a huge 80x24 character screen. These versions put almost twice as many characters on the screen !!!

HAVE WE GOT A VERSION FOR YOU ?

The Electric Pencil II operates with any 8080/Z80 based microcomputer that supports a CP/M disk system and uses a Imsai V10, Processor Technology VDM-1, Polymorphic VTI, Solid State Music VB-1B or any similar memory mapped video interface. REX versions now available. Specify when using CP/M that has been modified for Micropolis or North Star disk systems as follows: For North Star add suffix A to version number, for Micropolis add suffix B to version number, e.g. SS-IIA, DV-IIB.

Vers	Video	Printer	Price

clock is given on the top line of each page, exact to the second.

A small key pad is provided. Keying a page number selects that page from the stream and stores it in the set for display as required. Normally only one page is stored but this is limited by economics alone. Storage may be for seconds or weeks if necessary. Extra pages above the basic 800 are obtained by using sets of pages with the same page number, and cycling them over several minutes, or even once per day. The keypad has extra buttons that permit normal picture display, Teletext display and combined display. It also has clock time setting switches that allow a page to be selected at a given time and stored to be displayed at leisure.

To use the set as a personal video display unit, one merely needs to input serial bytes in the published standard Teletext format via a spare channel. Superb facilities are available, all controlled by the data. Characters are of a high standard since they are generated as video signals by the Teletext unit with an equivalent bandwidth of about 14 MHz. The whole ISO-7 ASCII set is available with upper and lower case. Additionally, there are 64 graphics characters (permitting maps and other displays). These are in a 3 by 2 rectangle using one of six bits to give all possible on or off combinations. A duplicate upper case permits legends within the graphics.

The Teletext unit has direct control of the three color guns, permitting all characters to be displayed as black, white, red, green, yellow, blue, magenta or cyan in almost any combination, against a background of a chosen color. Any or all of the characters may be flashed on and off to attract attention.

A special control character may be used to open and close a box in the normal picture. The box may be of any size or shape and in any position on the screen. This facility is normally used for subtitles and news flashes, but could allow part of the screen access to the personal computer while the family watches a normal program on the rest of it. The store is continually updated by incoming new or repeat data but, if required, the whole page may be erased before a new page is started.

Overall, this set seems to have a high potential of usefulness. This may increase in the future since several control characters are still spare. In Britain this video display unit is also being standardized for telephone data so that all possible digital information services may use the household television, giving a minimum total cost. One wonders what the limit is going to be. ■

Adding Lowercase Display to the ADM-3A

A W Walker
1914 Ridgewood Dr
San Diego CA 92139

The scenario: you wanted a good quality, versatile video display, so you stretched the budget to the limit to buy a "dumb" terminal kit. After it's all together, you're showing off the result of your assembly skills when someone innocently asks "Does it have lowercase?" Well no, it doesn't, actually. You ask around, and find there is a way, but at \$89, the kit from Lear Siegler doesn't quite fit the constraints. So a short expedition into the innards of the ADM-3A should be helpful; after all, one should only need a bit more of a character generator read only memory to do the trick. Lo and behold, the designers at Lear Siegler have even provided the socket, so let's see what fits into it. The

ADM-3A maintenance manual explains nicely on page 6-11 that "the lowercase read only memory is a custom masked part" whose distinguishing attribute is that "all of the address lines. . . are inverted." Well, just how unusual is that custom read only memory? After some experimentation and further delving into the mysteries of the schematics, it appears that all one has to do is turn over the six character address bits, use a readily available lowercase 2513 for about \$9.95 and be on the air. An easy way to invert six bits might be with a 74LS04 transistor-transistor logic (TTL) integrated circuit.

To avoid any modifications to the

TRS-80 TRANSFORMED WITH PROFESSIONAL SOFTWARE PACKAGE

Lifeboat Associates, specialists in microcomputer disk software, is proud to offer the first professional disk-based language and utility package for the Radio Shack TRS-80 computer. Written by Microsoft, creators of Level II BASIC, the package runs on a TRS-80 system with 32K RAM, one or more drives and TRSDOS. The software is supplied on diskettes and consists of:

FORTRAN a true relocatable machine code compiler for ANSI FORTRAN X3.9, except COMPLEX variables

MACRO ASSEMBLER a disk based macro assembler utilizing Zilog mnemonics and producing relocatable code

LINKING LOADER to link, edit and load FORTRAN and assembler modules for execution

SUBROUTINE LIBRARY a complete library of subroutines existing as relocatable linkable modules for FORTRAN or assembler programs (e.g. double precision square root, natural log, transcendentals, etc.)

DISK TEXT EDITOR to create and modify FORTRAN and assembler programs as disk files; also can be used as a general purpose text editor for correspondence and other documents

This high-powered professional software package with full documentation is available at the DISCOUNT PRICE OF \$

Figure 1: Modifications that must be made to the existing ADM-3A to produce lower case characters.

NEW FROM XITEX

SEND:

- 1 to 150 WPM (set from terminal)
- 32 character FIFO buffer with editing
- Auto Space on word boundaries
- Grid/Cathode key output
- LED Readout for WPM and Buffer space remaining

SERIAL INTERFACE:

- ASCII (110, 300, 600, 1200) or Baudot (45, 50, 57, 74) compatible
- Simplex Hi V Loop or T²L electrical interface
- Interfaces directly with the XITEX[®] SCT-100 Video Terminal Board; Teletypes[®] Models 15, 28, 33, etc.; or the equivalent

\$95 MORSE TRANSCIVER

COPY:

- 1 to 150 WPM with Auto-Sync.
- Continuously computes and displays Copy WPM
- 80 HZ Bandpass filter
- Re-keyed Sidetone Osc. with on-board speaker
- Fully compensating to copy any 'list style'

See your local dealer or contact XITEX[®] direct.

MC/Visa accepted

MRS-100 CONFIGURATIONS:

- \$95 Partial Kit (includes Microcomputer components and circuit boards; less box and analog components)
- \$225 Complete Kit (includes box, power supply, and all other components)
- \$295 Assembled and tested unit (as shown)

Overseas Orders and dealer inquiries welcome

ADM-3A, I built my lowercase adapter on a 24 pin dual-in-line plug that inserts into the existing lowercase read only memory socket (location L14) in the terminal. On top of the plug I mounted a small piece of 0.1 by 0.1 inch (0.254 by 0.254 cm) perforated board with sockets for the added lowercase 2513 and the 74LS04 inverter. Using this assembly method requires fairly careful consideration to avoid interference with the cabinet top or other components. For more compact assembly, the perforated board and sockets might be omitted with the new read only memory mounted directly on the plug and the inverter glued in place upside down on top. Since all but six of the read only memory's pins are connected directly to those of the plug, adequate support is available. The remaining six pins needing inversion can be bent out for appropriate connection to the 74LS04.

Regardless of the final mounting and installation method chosen, the required wiring is given in figure 1. Note that two additional 2102-1 memories are required, which plug into locations J11 and H11 to store the uppercase/lowercase data bit on characters stored in the display memory. The total cost of materials for my unit is \$14.25, and it can be built for less depending upon your junk-box, where you shop for parts, and the method of construction.

Once installed in the ADM-3A, and assuming the UC DISP-U/L DISP at the inside rear of the unit is set to U/L DISP with the LC EN-UC switch at the left of the key-

board set at LC EN, the result is a full 95 character terminal display including the 26 lowercase letters and five additional symbols as shown in table 1. Note that, since the characters are still only generated with a 5 by 7 dot matrix, the lowercase letters with descenders, such as g, j, p, q and y, do not actually display the descenders below the writing line, but instead are elevated so as to allow the characters, including descenders, to be displayed within the 5 by 7 matrix. This technique results in a very acceptable low cost upper and lowercase display. My customized ADM-3A has been in service quite satisfactorily for more than eight months. ■

Password Protection for Your Computer

R Jordan Kreindler
 USC Eastern Regional Office
 5510 Columbia Pike
 Arlington VA 22204

Is your computer available via the telephone? Do you plan to leave it in a public area but want to limit its use? Will your system be used in a school environment where access must be controlled?

If the answer to any of the above questions is "yes," this article should interest you.

A Simple Password Procedure

One way to restrict system access is by

Number of characters in password	Number of possible passwords
3	46,656
4	1,679,616
5	60,466,176
6	2,176,782,336

Table 1: Possible password combinations using upper case letters and digits.

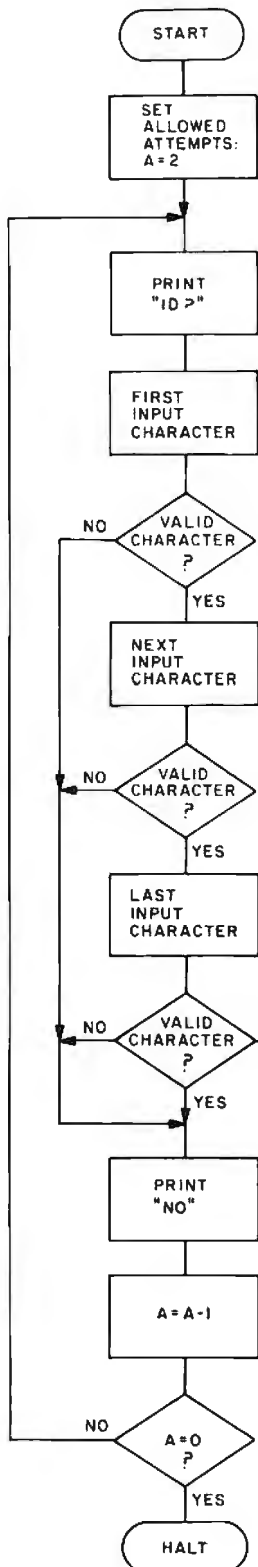

Figure 1: A simple password approach.

lock and key. An easier method is to set up a password requirement. The flowchart in figure 1 is one way of implementing a password subroutine. This figure shows a simple method for checking a 3 character password. Each character of the password is checked immediately after it is entered. Upon detection of an illegal character, "NO" is printed. As shown, the user is allowed two attempts to enter the correct password. If both attempts fail, the system halts.

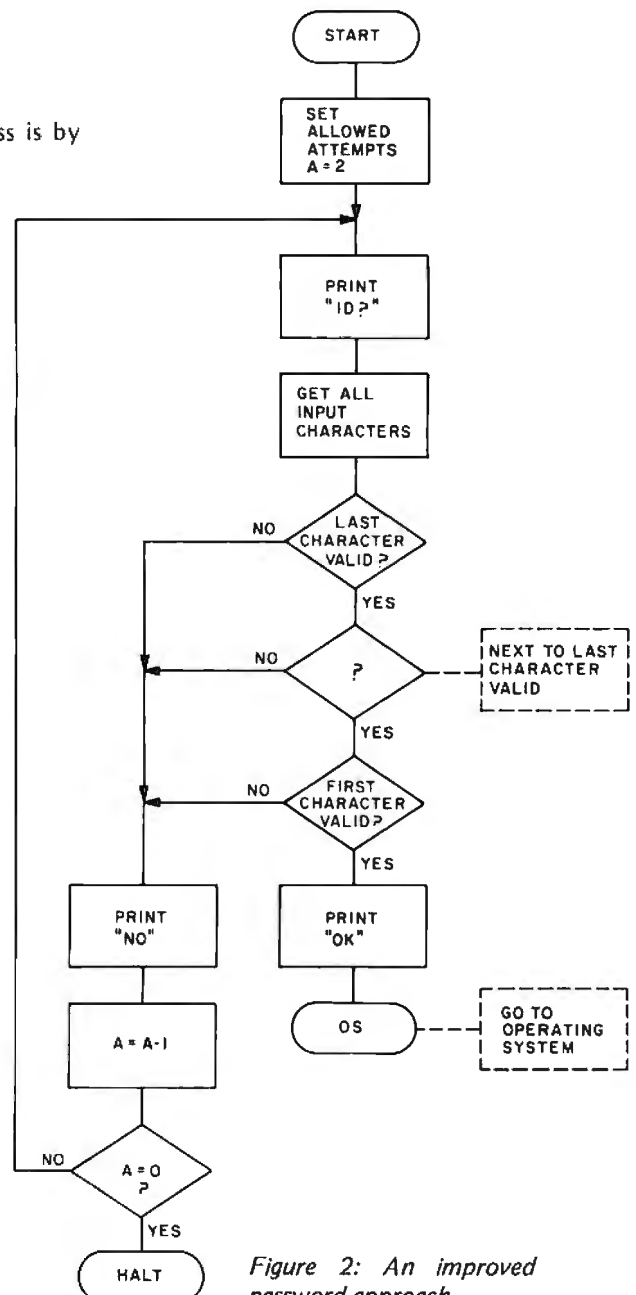

Figure 2: An improved password approach.

Assume that the 26 upper case letters and the 10 digits will be used to establish a password. For the algorithm in figure 1, a user could try, in order, all 36 characters to find the correct first character. After the first character is identified, the user could follow the same procedure to find the second character. Once the second character is found, the procedure could be repeated to find the third.

With this system, there are $36 + 36 + 36 = 108$ different possible passwords. This is too few combinations for adequate security.

An Improved Password Procedure

A better procedure is shown in figure 2. Here, a 3 character password is also used. However, in this method all characters are entered before the password is checked. Thus, a failing password yields little information. The user can't tell which of the characters is incorrect. All that is known is that the combination tried was incorrect.

With this procedure, there are $36 \times 36 \times 36 = 46,656$ possible passwords. This should be an acceptable level of security. If additional security is desired, the password can be expanded beyond three characters. Table 1 shows the number of different possible passwords in these situations. This table was developed with the assumption that only upper case letters and digits would be used in a password.

The program in listing 1 is an 8080/Z-80 coding of the algorithm in figure 2. The program as shown uses the password YES. It has been implemented on a North Star Horizon Computer. The following comments should allow this program to be modified for other systems (all numbers shown are in hexadecimal; DOS stands for disk operating system):

Statement	Comment
CALL 200D	Calls the DOS output routine.
CALL 2900	Outputs the character in the B register.
CALL 2900	Calls the DOS character input subroutine.
JMP 270F	Jumps to the DOS to allow normal system access.
MVI E, 53	Establishes the password as "YES." These three statements are where you establish your own password.
MVI E, 45	
MVI E, 59	

A password subroutine is easy to implement and requires little computer memory. However, it increases the security of your system. ■

Listing 1: An 8080/Z-80 assembler listing of the improved algorithm for a 3 character password. This program is written for the password YES.

The Power of the HP-67 Programmable Calculator, Part 1

Robert C Arp Jr
POB 1268
Minden NV 89423

Introduction

This article is not a simple product review. Rather, it is the presentation of a complex programming example designed to illustrate the exploitation of a computing system composed of the HP-67 and its accessories, and worksheets that reduce the task of programming the calculator to a systematic exercise. The HP-67 is a pocket-sized version of the HP-97. The built-in thermal printer of the HP-97 is the major difference between the calculators. The HP-67 is shown in photo 1.

In addition to the HP-67, there are other sophisticated programmable calculators available at price levels which attracted consumers to the first scientific calculators in 1972 and the years following. I purchased my HP-35 early, and until the introduction of the HP-67 I considered it to be the finest calculator ever manufactured.

I must admit that I was intrigued by the features of the SR-52 when it was introduced. However, three of the Hewlett-Packard features force me to vote for the HP-67: choice of display format (fixed decimal, scientific and engineering; all with number of digits control), reverse Polish notation (RPN), and my previous experience with Hewlett-Packard. (Since 1972 I have experienced zero down time with the HP-35. Therefore, I am properly impressed with HP quality.)

Although I expect to see calculators with more memory capacity and some increase in programming capability in the future, I think the HP-67 represents a plateau of sophistication that will satisfy the needs of a large percentage of users. The HP-67 has 26 data storage registers, 224 steps of program memory (each step can hold as many as three keystrokes), unconditional and conditional branching, three levels of subroutines, four flags, 20 labels, indirect addressing, and, if that isn't enough, it accepts magnetic cards that record data or programs. In addition, each of the 35 keys control up to four separate operations, and, of course, it is completely portable with the rechargeable battery pack.

Photo 1: The HP-67, one of the sophisticated pocket calculator products which represent the small end of the personal computing hardware range.

ARE YOU TAKING FULL ADVANTAGE OF YOUR COMPUTER?

NO

Then we want you. Assembled at the Personal Computing Festival of the 1979 National Computer Conference will be scores of experts with diverse backgrounds. Your imagination cannot help but be triggered with new uses and applications for your own computer. Over 25 technical sessions will cover such topics as: languages, education, robotics, small business applications, speech synthesis and recognition, and investment analysis. Live demonstrations of applications by individual users will enable you to see the latest personal computing realities in action. Commercial exhibits will bring you up-to-date on industry offerings in microcomputer products, systems, and services. Take full advantage of your computer by attending the NCC Personal Computing Festival at the Americana Hotel in New York City, June 4-7. For continuing information about the complete computing experience at NCC, simply fill out and return the coupon below.

YES

Then we need you. You have developed an application to a point where your results are up to your own high personal standards. Speak to us, and the world, at the NCC '79 Personal Computing Festival. You can help your friends and colleagues take full advantage of their own computers by presenting a paper, chairing a session, or demonstrating your application. Valuable prizes will be awarded for outstanding applications demonstrations and for the best papers published in the *NCC '79 Personal Computing Proceedings*. Fill out the coupon below, check the box on conference participation, and we'll send you complete information. Time is short, so you must act promptly. But remember...whether or not you're presently taking full advantage of your computer, there's a world of information on the very latest in personal computing awaiting you at NCC '79 in New York.

NCC '79

PERSONAL COMPUTING FESTIVAL

c/o AFIPS, 210 Summit Avenue, Montvale, N.J. 07645

- Please keep me up-to-date on NCC '79 and its Personal Computing Festival.
- I'm interested in making a presentation and have enclosed a description of my topic.
- I'm interested in demonstrating my own personal computing application and am enclosing a description of it.
- My company is interested in exhibiting at the Personal Computing Festival.
- Please send information on the NCC '79 Travel Service.

Learning to Use the HP-67

Table 1 is a list of cautions which should be memorized before using the HP-67. These simple rules will allow maximum utility with minimum misery. After memorizing these rules, read Appendix B of the HP-67 handbook before attempting to use the calculator.

The HP-67 is a very powerful computer. One should not expect to memorize the *Owner's Handbook and Programming Guide* with a cursory reading. (The handbook is almost 3/4 inch thick.) Its contents should be digested in two stages: After acquiring your HP-67, read the handbook leisurely for two or three days, performing calculations when necessary. Next, design programs that require as many functions as possible, referring to the handbook often.

In addition to the *Owner's Handbook and Programming Guide*, the HP-67 is accompanied by a "Standard Pac" of programs which includes:

- 15 prerecorded magnetic cards containing programs for problems common to business, science and engineering, a diagnostic program and an abrasive cleaning card.
- 24 blank magnetic cards.
- *Standard Pac Handbook*.

The *Standard Pac Handbook* contains a description of each of the standard programs, instructions for running the programs, example problems, program listings and explanations of important programming techniques. As part of learning to use the HP-67, an owner should be sure to read this handbook. Pay particular attention to any

Table 1: A list of precautions for prospective users of the Hewlett Packard HP-67 and HP-97 programmable calculators.

1. Always have a battery pack installed in calculator.
2. Connect the calculator to the charger using the following steps: a. Turn HP-67 off. b. Connect charger to calculator. c. Plug charger into power outlet. d. Turn HP-67 on.
3. Disconnect the charger from the calculator using the following steps: a. Turn HP-67 off. b. Unplug charger from power outlet. c. Disconnect charger from calculator.
4. Leave the W/PRGM-RUN switch in the RUN position except when programming or recording a program.
5. Check each program of the Standard Pac and your Application Pacs as soon as you receive the Pacs. Don't wait until the need occurs to discover an error.
6. Store partially completed programs on two blank cards. Don't trust yourself with only one copy.
7. If any difficulty is experienced when removing a program card from the window slot, press down on the card with a pencil's eraser and slide the card out of the slot.
8. If the motor begins to sound as if it is laboring, a pass or two of the abrasive cleaning card may clear up the problem. Remember, also, that a fully discharged battery pack must be charged for five minutes before a card can be read.

programming techniques you might be able to utilize.

Application pacs (which include business decisions, statistics, mathematics, electrical engineering, clinical lab, nuclear medicine, mechanical engineering, and surveying) contain about 20 prerecorded program cards apiece and a handbook containing a description of the programs with relevant equations, instructions for running the programs, example problems and program listings.

All prerecorded cards in the pacs have printed mnemonics which substitute for the instructions after a few familiarization runs. The mnemonics include input variables, keys to be pressed and outputs to be expected. A full explanation of the mnemonic symbols for the magnetic cards may be found on page vi of the *Standard Pac Handbook* and in each *Application Pac Handbook*.

Key Functions

All of the HP-67 Key Functions are discussed briefly on pages 8 thru 13 of the *Owner's Handbook and Programming Guide*. The mathematical key functions are discussed in detail in the first 120 pages of the guide. Following this is a complete description of the programming key functions. Card reader operations and the appendices take up the rest of the guide.

Many of the mathematical and programming functions are self-explanatory by their designations. Examples of these, which would be familiar even to those people unfamiliar with Hewlett-Packard calculators, are \div , \times , $+$, $-$, π and \sqrt{x} . Experienced users should recognize ENTER, CHS, EEX and CLX. After brief explanations, it is easy to remember the function of most unfamiliar keys by their abbreviations: STK = stack review, ABS = absolute value, INT = integer portion, FRAC = fractional portion, RND = round off, STO = store, and RCL = recall.

32 of the keys may be used as a single stroke function, or they may be preceded by one of three prefix keys (two stroke function) and, occasionally, they may be followed by another function key (three stroke function). These 32 keys are used to provide 116 functions (five are redundant), but because the key designations closely describe the functions performed, they are easily memorized. I also found the mathematical functions listed in table 2 to be especially useful.

Functions I Would have Appreciated

The programming functions of the HP-67

FUNDAMENTALS OF COMPUTER ALGORITHMS

by E. Horowitz and S. Sahni

□ The concept of computer algorithms is fundamental to any study of computer programming. Horowitz and Sahni present the subject completely, covering the underlying strategies, design techniques, analysis, and testing of algorithms. Problems and exercises are included, using an ALGOL/PASCAL-like language. Twelve chapters; an essential text. 626 pp. \$19.95 hardcover.

FUNDAMENTALS OF DATA STRUCTURES

by E. Horowitz and S. Sahni

□ This text covers the other half of computer programming; data structures, their specification, design, evaluation, and realization in a programming language. Chapters include: arrays, stacks and queues, linked lists, trees, graphs, internal sorting, external sorting, symbol tables, and files. Many examples and exercises are provided, using an ALGOL/PASCAL-like language. 564 pp. \$18.95 hardcover.

A COLLECTION OF PROGRAMMING PROBLEMS AND TECHNIQUES

by H.A. Maurer and M.R. Williams

□ Here is a book that presents you with problems — nearly 400 of them: problems and games like chess, bridge, NIM; practical problems such as applications of the law of science, Kramer's rule of solving simultaneous equations, and applications of Latin squares, to problems of probability. The most valuable feature of the book is its careful and thorough explanation of the use of algorithms to solve problems. No dyed-in-the-wool programmer or experimenter will be able to read this book for very long before trying to solve the tantalizing and well presented problems. 256 pp. \$15.00

THE ART OF COMPUTER PROGRAMMING

by D.E. Knuth

□ **Volume I, Fundamental Algorithms**, Second Edition, begins with a thorough discussion of the mathematics used in computer programming, followed by a treatment of information structures, stacks, arrays, linked lists, dynamic storage allocation, and trees. 634 pp. \$22.50 hardcover.

□ **Volume II, Seminumerical Algorithms**, Second Edition, is concerned with random numbers, statistical tests, random sequences, as well as arithmetic (floating point and multiple precision), polynomials, and rational arithmetic. 624 pp. \$22.50 hardcover.

□ **Volume III**, deals with **Searching and Sorting**, as the name implies, the emphasis is on algorithms for sorting, including combinatorial properties of permutations, internal sorting, optimum sorting, and external sorting. Also included is a section on sequential searching, hashing, digital searching, and more. 722 pp. \$22.50 hardcover.

A hypothetical assembly language called MIX has been developed by the author to illustrate programming examples throughout the series. MIX is easily convertible to other assembly languages.

Building Your Programming Foundation...

ALGORITHMS + DATA STRUCTURES = PROGRAMS

by Niklaus Wirth

□ "Programs, after all, are concrete formulations of abstract algorithms based on particular representations and structures of data". Niklaus Wirth here presents the fundamental concepts of algorithms and data structures and their interdependence. In his lucid treatment he covers fundamental data structures, sorting, recursive algorithms, dynamic information structures, language structures and compilers, using PASCAL in the examples and exercises. An important text. 366 pp. \$19.95 hardcover.

certainly allow the writing of complex programs. Yet, I would ask for the following additional features:

- I would like to be able to clear registers R0 thru R9 with one or two keystrokes, without clearing registers A thru E and I. (Pressing f CL REC clears primary storage registers R0 thru R9 plus A thru E and I.)
- I would like to be able to perform direct storage register arithmetic upon the contents of all registers. (Storage register arithmetic can be performed directly upon the contents of registers R0 thru R9 only. *Indirect* storage register arithmetic can be performed upon the contents of any storage register.)
- I would like to be able to directly address all storage registers. (Registers R0 thru R9 and registers A thru E and I can be addressed directly, while registers RS0 thru RS9 can be addressed indirectly or by pressing f P \approx S.)

Most Appreciated Features

Personally, I think the most powerful HP-67 functions are the five program editing and manipulation functions. These five functions are nonrecordable operations that assist you in altering and correcting your programs.

The SST (single step) function may be used while either programming or running a program. When SST is pressed (with the W/PRGM-RUN switch set to W/PRGM) the calculator moves to and displays the next step of program memory. This allows you to view each step of the program without execution. If SST is pressed while the W/PRGM-RUN switch is set to RUN, the calculator displays the next step of program memory, and, when you release the SST key, the calculator executes the instruction loaded in that step. This operation is especially useful when debugging a program.

Table 2: Some useful mathematical functions available on the HP-67 and HP-97 programmable calculators.

Function Name	Definition
P	Rectangular to polar coordinates conversion
R	Polar to rectangular coordinates conversion
LSTx	Recalls number displayed before the previous operation
R	Converts degrees to radians
D	Converts radians to degrees
DEG	Sets decimal degrees mode for trigonometric functions
RAD	Sets radians mode for trigonometric functions
GRD	Sets grads mode for trigonometric functions
H.MS	Converts decimal hours or degrees to hours, minutes and seconds, or degrees, minutes and seconds
H.MS+	Adds hours, minutes and seconds (or degrees, minutes and seconds) in the Y register to those in the X register

When the W/PRGM-RUN switch is set to W/PRGM, the h BST operation causes the calculator to move to and display the previous step of program memory. If the W/PRGM-RUN switch is set to RUN, pressing BST, after h has been pressed and released, causes the calculator to display the contents of the previous step of program memory. When BST is released, the original contents of the X register are displayed, the calculator having executed no instructions.

The GTO.nnn operation permits you to jump to any location in program memory for editing, additions or corrections to a program. When GTO. is pressed, followed by a three digit step number, the calculator transfers execution so that the next operation or instruction will begin at that step number (this happens whether the W/PRGM-RUN switch is set to W/PRGM or to RUN). No instructions are executed.

When the W/PRGM-RUN switch is set to W/PRGM, a press of h DEL will erase the instruction at the current step of program memory, and all subsequent instructions in program memory move upward one step. (Note: Any time an instruction is inserted between existing instructions in a program, all subsequent instructions in program memory move downward one step. Thus the HP-67 has a true insertion capability.)

Programming the HP-67

A program for the HP-67 is nothing more than a listing of the keystrokes necessary to perform the desired calculations manually, plus the labels to define the beginning and ending of the program, loops and subroutines. The listing may be prepared using a worksheet such as that shown in figure 1. The form shown is page 1 of a set of five with preprinted program steps from 1 thru 224.

When creating programs, remember that any solution that gives the correct outputs may be a suitable program. There is no *one* correct program for any problem. Emphasis, when programming, must only be placed on *time*. The *time* spent in programming must be compared to the *time* involved in running the program and the number of *times* the program will be used. It would be silly to spend days modifying a program with a running time of 30 minutes so that it could be run in 20 minutes if the program is to be used only two or three times.

In addition, programming is a personal art. Spend enough time creating your programs to satisfy your own artistic fastidiousness. Of course, you are limited to the available memory. However, the example to be discussed illustrates that very complex

problems can be handled with 224 steps of program memory. Furthermore, don't forget that data may be stored on the magnetic cards, and this memory is limited only by the number of blank cards you purchase.

The guide (and probably every other publication which discusses programming) suggests that a flowchart be drawn for each program. A flowchart breaks down a program into small groups of instructions which can be handled more easily than the entire program. In addition, flowcharts can be used as documentation for the program. I cannot argue with this reasoning because it seems logical. I can only say that I personally find flowcharts worthless when they are drawn, and I can, within the limits of my capabilities, write a program while another pro-

grammer is fooling around with the flowchart.

I certainly do suggest, however, that you try the flowchart approach to programming, but don't be surprised if you find it easier to tackle the program directly. For documentation, I believe that comments with the program and the run instructions are more valuable than any flowchart, especially a year or two after the program is written.

While creating a program, a review of the "Function Key Index" every now and then will keep the full repertoire of the HP-67 fresh in your mind. This is important if you want to take advantage of the many mathematical, branching and looping functions available. Also, since there are usually many ways to accomplish a desired series of steps, spend a moment or two thinking of the various possibilities. For example, if a conditional test must be executed, would $g X=Y$, $f X=0$, $f DSZ$, $f ISZ$, $g DSZ(i)$ or $g ISZ(i)$ fit best in your program? Each of these functions are designed to be used in slightly different ways, yet all of them may be used to test for zero.

When $g X=Y$ and $f X=0$ are used, the calculator branches around the next instruction if the question asked by the conditional is not true; $f DSZ$ and $f ISZ$ decrement or increment the contents of the I register unless its contents are zero, and, if the number in the I register has become zero, program execution skips the next step just like a false conditional instruction; $g DSZ(i)$ and $g ISZ(i)$ decrement or increment the contents of the storage register addressed by the current number in the I register unless the contents of the addressed register are zero, and, if the number in the addressed register has become zero, one program step is skipped.

These functions, as well as the many other programming functions, are fully explained in the guide. Since it is not my desire to reprint the guide, I will not dwell upon these explanations. I would, however, like to mention two other types of choices that must often be made.

One of these choices is whether to branch forward or to branch backward. A backward branch, which is usually executed faster, becomes necessary when all labels have been used for other purposes. But any correction to the program after the backward branch has been added may necessitate a correction to the number stored in the I register. (It is the number stored in the I register which causes the jump.)

The other choice is whether or not a subroutine should be used to accomplish the functions performed by a group of keystrokes used more than once during program

INTRODUCING G2 LEVEL III BASIC.

Now do more than ever before with the most powerful Basic you can buy for the TRS-80.

Open the manual and load the cassette. Then get ready to work with the most powerful Basic interpreter you've ever had your hands on...Level III Basic for Radio Shack Computers. It loads right on top of the Level II ROM, and in just 5K of space, opens up your capability to new dimensions. For starters, this new cassette-based interpreter gives you the whole catalog of disk programming power. Plus graphics commands. Plus powerful editing commands. Plus long error messages, hex and octal constants and conversions, user defined functions and a number of commands never before available on either cassette or disk interpreters!

Easier Loading, Fewer Keyboard Errors. G2 Level III Basic eliminates aggravations you've had, including keyboard "bounce" and those super-sensitive tape deck settings. Programs will load easier, and you'll have far less trouble with input errors.

Basic Access to RS-232. Until now, if you wanted to access your RS-232 interface, you had to work in assembly language. G2 Level III Basic does the work for you, letting you use your interface with Basic statements.

Have You Wished for More Power? This new interpreter gives you 10 machine language user calls for subroutines, long error messages, a new TIMES\$ call for your real time accessory, plus measure or limit input timing that lets you put a time limit on responses when you're playing games or giving exams. And the list doesn't stop here.

Easier and More Powerful Graphics. This new Basic includes three simple commands that can eliminate dozens of program steps. PUT transfers information from a designated array to your screen; GET reverses the process. LINE makes your computer do the work when you input beginning and end points. Give it two diagonally opposite corner locations, and it'll outline the rectangle you're looking for.

Only Microsoft Could Do It. G2 Level III Basic was created by Microsoft, the same company that wrote Level II Basic for Radio Shack. And it actually uses Level II as a foundation for this enhanced add-on. By the time you've mastered all it can do, calling up the flexibility of the graphics commands, and even enjoying the convenience of renumbering, you'll wonder how it was all possible. It's like getting a whole new computer for your computer.

Available Now for Only \$49.95. You get the power that might otherwise cost you hundreds of dollars in additional equipment for only \$49.95. Price includes the User Manual, a Quick-Reference Card, and a preprogrammed cassette tape. Load the tape, open the manual, and get ready to work with the most powerful Basic Interpreter you've ever had your hands on. G2 Level III Basic for the TRS-80. Another member of the growing G2 Personal Computer Program Library.

For the name of the G2 dealer nearest you, call us toll-free at 800/538-8540 or 800/538-8541. In California, please call 800/672-8691.

GRT A Product of GRT Corporation
Consumer Computer Group
1286 North Lawrence Station Road Sunnyvale California 94086 408 734-2910

**THE REASON
YOU BOUGHT
YOUR COMPUTER.**

execution. Because of the run time needed to search for the subroutine and the discontinuity in the program which results, I recommend not using subroutines unless it is absolutely necessary to save space in memory to accommodate a program which would otherwise have more than 224 steps.

I have seen commercial programs so riddled with subroutines that the programs had to be completely rewritten at enormous expense after the programmers were replaced. Of course, you would not want to punish yourself this way. When you own the calculator, you don't pay for computer time or memory. It costs you the same to run a 224 step program as it does a five step program.

As I have stated above, the guide covers all programming operations thoroughly. There is one operation I found difficult to implement. I am referring to the g MERGE function, but now that I have performed the function successfully, I can't imagine the cause of the difficulty I experienced.

The g MERGE function allows data or programs from magnetic cards to be merged with data or programs in the calculator. When a program from a card is merged with one in the calculator, steps 000 thru nnn of

the original program are preserved. This function permits you to add to or alter a program that is already loaded in the calculator.

In fact it is possible to include the g MERGE instruction immediately preceding the h PAUSE instruction in a program and to load a program or data from a magnetic card into the calculator while a program is running. Not mentioned in the guide is the fact that when a program is loaded during a pause in a running program an h RTN immediately following the h PAUSE will be overwritten by the first step of the merging program and execution of the new program will begin immediately after it is loaded.

Card Reader Operations

One of the primary reasons the HP-67 is such a versatile calculator is its ability to store information on magnetic cards and to retrieve this information at a later time. Therefore, I would like to stress the following points concerning this operation:

- When storing the contents of the registers on a data card, always pass side 1 of the card through the card reader first, then side 2, if necessary. This insures that any nonzero data in the secondary registers will always be stored on side 2 of the card.
- When it is necessary to restore data from only one side of a magnetic card into the calculator, pass the side of the card which contains the data through the card reader. Then, when crd is displayed, press CLX.
- Accidents may occur that will destroy the program or data on a card, therefore, if the information to be stored is important or extensive, do yourself a favor and store it on two cards.
- Identify the information on your magnetic cards with a #2 pencil. When necessary, the cards can be easily erased.
- When inserting the leading edge of a card to be read into the card reader automatically during a pause, remember that the program must actually be running when you insert the leading edge. Be sure to insert the tip of the card far enough into the card reader. ■

Next month's concluding installment of this article features an example program showing how the HP-67 can be used to solve simultaneous network equations for an electrical network.

Retro-Graphics™

For your Dumb Terminal. The Retro-Graphics PC card mounts easily in the Lear Siegler ADM-3A to provide you with an affordable graphics computer terminal.

Features:

- Z-80 Based
- 512 by 250 Dot Matrix
- Simple Plug-in Interconnect
- Point Plotting
- Automatic Vector Generation
- Optional TEKTRONIX Software Compatibility

You will be impressed with the packaging, performance and price of the Retro-Graphics card. Write or phone today for complete specifications.

Computer Assisted

Flight Planning

The production of flight plans is a task that lends itself well to computer solution. It is a time-consuming and repetitious job involving numeric manipulation and output formatting, just the sort of thing that computers do accurately and quickly. The drawback has been, of course, that computer facilities have not been made available to pilots in a way that allows timely production of flight plans. To be useful, flight plans must reflect accurate route and weather data, and so cannot be produced too far in advance. The solution, of course, is that the increased availability of computing facilities made possible by the microprocessor makes automated flight planning practical even for private pilots.

The heart of any flight planning system consists of three calculations. Indeed, anything else the system may provide is really the option of the system's designer. The first necessity is a true air speed calculation. Without going into too much detail, airplanes fly with "indicated" air speeds, but flight plans need "true" air speeds for their calculations. The formula used in my program is:

$$\begin{aligned} \text{true air speed} = & \text{indicated air speed} \\ & \times [.971 + \text{temp} \times \{ (.017 + \text{INT} \\ & \text{(altitude} / 50.1) \times .002\} / 10 \\ & + \text{altitude} / 10 \times (.02 + \text{INT} \\ & \text{(altitude} / 50.1 \times .00035)] \end{aligned}$$

This formula provides accuracy within 1 knot up to altitudes of 15,000 feet. The error is somewhat greater than that above 15,000 feet, but might be considered acceptable up to 20,000 feet. For private sector flying this formula should provide excellent accuracy and reasonable simplicity. Another simpler formula is usable up to altitudes of 8,000 feet:

$$\text{true air speed} = \text{indicated air speed} \times \{ \text{temp} \times .002 + \text{altitude} / 10 \times .018 + .971 \}$$

There are formulae which purport to give absolute accuracy at all altitudes, but those that I am familiar with are extremely cumbersome and time-consuming.

LSI-11 TIME

It's **TIME** you brought your LSI-11 up to **DATE**. **TIME** and **DATE**, two important parameters in the computer world, are available to your LSI-11 on one **DUAL SIZE BOARD**. When requested, the TCU-50D will present you with the date (month and day), time (hour and minutes), and seconds. Turn your computer off and forget about the time — your battery supported TCU-50D won't, not for 3 months anyway. The correct date and time will be there when you power up.

The TCU-50D is shipped preset to your local time, but can be set to any time you want by a simple software routine.

AT \$295

YOU CAN'T AFFORD TO IGNORE TIME

Time is only one way we can help you upgrade your LSI-11 or PDP-11 system. We'd also like to tell you about the others. So contact Digital Pathways if you're into -11's. **We are too.**

The LATEST in Tape Systems

NEW!

9600 BAUD CASSETTE RECORDER

An ASYNCHRONOUS NRZ type Recorder with remote motor start/stop. Error rate 10^8 at 4800 BAUD. Can be used from 110 to 9600 BAUD into a UART — no clocking required. This is not an audio recorder. It takes RS232 or TTL signals from the terminal or computer and gives back the same signals. No audio interface is used. Motor start/stop is manual or through TTL or RS232 signals.

Tape speeds are 1.6" / 3.0" and 6.0" per second. 110 volt, 60 Hz, 5 watts. (220 Volts on special order). Can use high quality audio cassettes (Philips Type) or certified data cassettes.

Recommended for DATA LOGGING, WORD PROCESSING, COMPUTER PROGRAM RELOADING and DATA STORAGE. Manual control except for motor start/stop. 6800, 8080 or Z80 software for file or record searching available on request with order. Used by major computer manufacturers, Bell Telephone and U.S. Government for program reloading and field servicing.

MODEL CC-9

\$200.00 (4800 Baud)

\$220.00 (9600 Baud and 220V/50 Hz)

AVAILABILITY — Off the shelf.

PROVIDES MONITOR AND TAPE SOFTWARE in ROM. TERMINAL and TAPE PORTS on SAME BOARD. CONTROLS ONE or TWO TAPE UNITS (CC-8 or 3M3B).

This is a complete 8080, 8085, or Z80 system controller. It provides the terminal I/O (RS232, 20 mA or TTL) and the data cartridge I/O, plus the motor controlling parallel I/O latches. Two kilobytes of on board ROM provide turn on and go control of your Altair or IMSAI. NO MORE BOOTSTRAPPING. Loads and Dumps memory in hex on the terminal, formats tape cartridge files, has word processing and paper tape routines. Best of all, it has the search routines to locate files and records by means of six, five, and four letter strings. Just type in the file name and the recorder and software do the rest. Can be used in the BiSync (IBM), BiPhase (Phase encoded) or NRZ modes with suitable recorders, interfaces and software.

This is Revision 8 of this controller. This version features 2708 type EPROM's so that you can write your own software or relocate it as desired. One 2708 preprogrammed is supplied with the board. A socket is available for the second ROM allowing up to a full 2K of monitor programs.

Fits all S100 bus computers using 8080 or Z80 MPU's. Requires 2 MHz clock from bus. Cannot be used with audio cassettes without an interface. Cassette or cartridge inputs are TTL or RS232 level.

AVAILABILITY — Off the shelf.

2SIO (R) CONTROLLER \$190.00, Tested & Assmb.

NEW!

→ DOUBLE DENSITY FLOPPY DISK CONTROLLER

A new floppy controller for 5" and 8" drives utilizing the new 1791 chip to provide single or double density recording. Flip the switch to use one or the other mode. Can load memory from single density and re-record it double density on the same drive so you can transfer or re-record your programs and files. Comes with new format program for double density on disk to replace your old single density format program. (Soft Sector IBM format). \$320. Assembled and tested.

SHIPPING STARTED OCTOBER '78.

NEW!

→ PEGASUS DOUBLE DISK ENCLOSURE and POWER SUPPLY

Holds one or two drives, has two drive power supply. 110 or 220V. Comes empty or filled with Shugart drives. Variations preclude listing prices. Call or write for full details.

SHIPPING STARTED OCTOBER '78.

Z 80 BOARD for SWTP COMPUTER

Now you can use the 8080/Z80 software programs in your SWTP 6800 machine. Replaces your MPU board with a Z80 and ROM so that you are up and running with your present SWTP memory and MPS card. 1 K ROM on board replaces MIKBUG and enables you to use XITAN Z80 software which we can supply.

AVAILABILITY — Off the shelf.

\$190.00, Tested & Assmb.

For U.P.S. delivery, add \$3.00. Overseas and air shipments charges collect, N.J. Residents add 5% Sales Tax. WRITE or CALL for further information. Phone Orders on Master Charge and BankAmericard accepted.

The second necessary calculation is drift. Drift is the measure of how many degrees off your intended course the wind will blow you if you let it. My program uses a one pass wind solution that gives the drift and ground speed after going through the formula just once. This particular solution has the disadvantage of requiring the use of an inverse sine (\sin^{-1}) in the calculation. The one pass drift formula is:

$$\text{drift} = \sin^{-1} \left[\frac{\text{wind velocity} \times \sin(\text{course} - \text{wind direction} - 180)}{\text{true air speed}} \right]$$

It is possible to substitute an inverse tangent calculation for the inverse sine. This substitution is:

$$\sin^{-1}(Y) = \tan^{-1}(Y/\text{SQRT}(1 - Y^2)).$$

The one pass ground speed formula is the third of the three necessary calculations. This formula will not work for direct head winds or tail winds. These conditions must be handled separately. In this program, I detected these situations prior to the drift calculation to save the extra step. The one pass ground speed formula is:

$$\text{ground speed} = \frac{\sin(180 - \text{course} + (\text{wind direction} + 180) - \text{drift}) \times \text{true air speed}}{\sin(\text{course} - (\text{wind direction} + 180))}$$

The special cases of direct head or tail winds are easy to handle. In either case the drift is 0. For head winds ($\text{course} - \text{wind direction} = 0$), the ground speed will be equal to true air speed minus wind velocity. For tail winds, ground speed will be equal to true air speed plus wind velocity.

An alternative to the one pass system is a *two pass* system. In this case the course is applied to the formula initially to obtain an estimate of the drift. This in turn is applied to the course to get a heading. The heading is then used in the formula to obtain the actual drift and ground speed. This routine is equally accurate and has the advantage that it requires no functions more sophisticated than sine and cosine. In an extreme case the sine and cosine functions could be obtained by reading a table.

As I said earlier, any output beyond these three basic pieces of information is at the discretion of the system's designer. I use a similar system to produce flight plans for low altitude and high-speed routes, which I fly as a C-130 instructor navigator. That system uses fixed route data stored on disk and produces precise ETAs (estimated times of arrival) and includes a lot of ancillary output information concerning altitudes,

And here's three more reasons why . . .

SARGON: A Computer Chess Program (Spracklen) offers the chess program that won first prize at the 1978 West Coast Computer Faire Chess Tournament! In book form (#5155-7, \$14.95) or on computer program tapes (#00603, TRS-80 Level II, \$19.95; #00604, Apple II, \$19.95).

BASIC MICROPROCESSORS AND THE 6800 (Bishop) gives you two books in one: a basic guide to microprocessors for the beginner, and a complete description of the M6800 system for the engineer. (#0758-2, \$11.95).

SIXTY CHALLENGING PROBLEMS WITH BASIC SOLUTIONS (Spencer) will sharpen your programming skills through games, puzzles, science problems, business problems, and mathematical recreations.

These three books add luster to Hayden's reputation as being #1 in personal computing books! Check them out at your local computer store!

paste, until the document is finished or the author is exhausted. To me, that is inefficiency! Of course, many computer text editors are not well suited to creative composition, being little more than teletypewriter editors. Even with many display editors one still has to resort to hard copy for effective editing. That is the nub of our problem: most display editors are line oriented and run on "glass teletypewriters." The latter were derived from hard copy terminals, which were in turn derivatives of keypunches—certainly an old way of thinking about text production. If the display media are truly utilized, however, a quantum improvement in editing facilities can result: information can be presented as in a "video book," complete with rapid random access paging and on screen cutting and pasting.

Given such a tool, creative composition becomes a joy. Freedom of expression is improved; the ideas flow freely from mind to screen. A phenomenon of egoless composition results; the author does not have to measure the content of a passage against the agony involved in its creation. As a result, the author is more willing to modify and polish the document, even experimenting with major revisions in order to present the topic in its best light. What is truly exciting is that the technology for such editing systems is now of modest cost; one need only break with the past ways of thinking about editors.

What does this have to do with our subject? There is a strong analogy between the editing task and the programming task. We must examine the programming task the same way we looked at editors. Alas, most of us still program on "virtual keypunches." We may even use one of these excellent display editors to create our card deck, but we create a linear string of characters and throw the completed program at a compiler; given that there are no syntax errors, we try to run the program, probably debugging with dumps, print statements, or debuggers which give us information in terms of the compiled code. If an error is found, we return to the editor to modify the source, recompile, and try again. Given these conditions, sloppy work habits are inevitable. In fact, the *conditions* are sloppy.

Editing Programs

Now we are at a critical point in programming: do we build a better "programming keypunch," or do we look for a programmer's tool analogous to the display editor? I would opt for the latter, and would

claim that the paradigm of LISP programming is the appropriate model from which we should begin.

First, let's examine the conservative "key-punch" approach. The traditional edit-compile-debug cycle is improved by a display editor, operating with a compiler that can return the user to the editor upon indication of a syntax error, pointing at the source statement that caused the error. A quick edit, and the syntax check cycle begins again. However, once the program is compiled, we are still at the mercy of primitive debugging techniques. One solution is to require that the user specify more information about the program, indicating expected behavior of program modules with the assumption that the compiling phase can be made more knowledgeable, and check the consistency of the expectations against the realities present in the user's encoded algorithms. This reassures us that the code which gets to the debug portion of the cycle does operate as expected. In general these user expectations are difficult to express, and checking their consistency is even more problematic. Syntactic consistency checks based on simple properties of the programmer's variables can be checked in a reasonably straightforward manner. Such properties are called

HARD DISC FOR S100 MICROS

The XCOMP DCF-10 Disc Controller provides the OEM with a high performance, low cost interface for fixed and removable (2315 or 5440) cartridge disc drives. The DCF-10 is currently supported by two operating systems. For information or manuals, contact XCOMP.

type structures. The compiler checks each occurrence of an identifier to ensure that it always has the same type; with simple variables, this involves checking such things as "Is it an integer?", "Is it a Boolean operator?" with procedures the compiler checks to make sure that the programmer's calls are consistent in the number of arguments supplied and the types of the parameters. Such consistency is important, but it usually requires that the programmer supply declarations throughout the program segments, specifying the type structure information of each and every identifier. This approach offers a short-term payoff in an increased probability that the generated code will perform as expected. But then, there's still the strong possibility that the programmer's errors are not so transparent that type checking can detect them. One approach is to improve the consistency phase, strengthening the compiler's ability to detect inconsistencies between expectations and reality. This requires that programmers express more and more of their expectations along with their algorithms; a program verification system results. Such a system would guarantee that the expectations expressed were consistent with the written algorithm. The debugging problem vanishes, but is replaced with a specification task that may be as difficult to accomplish as the debugging.

AI and Programming Expectations

What about programs whose expectations are not easily formulated? The primary example is artificial intelligence programming: often it is only the final algorithm itself which expresses the expectation. The creative programming process is driven by a partially understood phenomenon; the programming effort is to capture as much of that phenomenon as possible. We program in a world of great uncertainty, much like driving a car. We may have a reasonably detailed roadmap, but the path may involve traffic lights, accidents, and detours. We do not return home and restart every time we encounter an unexpected situation; we correct on the fly and continue. I feel that much of modern computation has this exploratory character of artificial intelligence.

What about programs which contain issues involving more than correctness? For example, it would be difficult to express the specifications of a text editor in terms of static conditions. To be sure, certain aspects of editors involve correctness, but usability is equally important. An experimental process is involved which requires modification and iteration. In fact the editor

exists for modification. If we made no typing errors we would not need an editor. For example, when we discover an error in a text file, we don't erase the whole file and retype it—we edit the error and keep the result. However in the traditional debugging paradigm, when we discover a runtime error, we throw away all the computation, edit the file, and restart. If that computation has taken several hours (or even minutes) to elicit the bug, it will be most painful to restart.

Most programming involves a deeper issue than debugging: it involves modifiability. Programs are always being modified because we change our expectations. Debugging is only a very minor component of the problem of program modification. Therefore, as we progress to more and more complex programming tasks, programming modification will take on a more fundamental role. Don't try to stamp out program modification as a manifestation of human frailty and error; it is a fundamental ingredient of our field. Cater to modification at the innermost levels of our programming systems. Assembly language continues to dominate systems design not because of innate masochism, but because of modifiability. There is a close (but low level) match between the language, the debugger, and the execution device. Any language that expects to dethrone machine language must offer an equally compelling environment.

"Modifying a Blank Screen"

One artificial intelligence researcher has characterized programming as "debugging a blank piece of paper." To that I would add: *programming is modifying a blank screen.* Get the machine into the programming process as soon as possible, but it must be done right. In that context we will see a rise in productivity comparable to that experienced in the editing task when a true display editor is used. We can expect egoless programming and good work habits to evolve naturally. With such tools the promise of structured programming can become a reality. That is, it is the *activity* of programming that involves the structuring. One should not expect to find structure in a program anymore than one can look at the final board positions of a chess game and tell whether that game was played by Masters or amateurs. Imagine programming systems whose "moves" involve stepwise refinement of partially elaborated programs; imagine the transcript of those keystrokes as comparable to the recording of moves in the chess game. The transcript of the program development would be available for analysis by programming students

The world's only single-chip LSI Universal Printer Controller is here!

The very low-cost 40-pin CY-480 printer with print speeds up to 200 cps! The Controller from Cybematic Micro Systems is the first—and only—40-pin LSI device which will control and interface any standard 5" x 7" dot matrix printer (including those from Victor, LRC, Practical Automation and Amperex) having a print speed up to 200 cps. It operates from a single +5V power supply and will interface a printer with any microcomputer or minicomputer system through standard 8-bit ports. The CY-480 accepts either serial (RS232C) or parallel ASCII input from the host system's data channel.

The CY-480 replaces bulky, expensive dedicated controllers. The small, single LSI package offers a 5 x 7 dot matrix character generator, full upper and lower case ASCII 96-character font, and a 48-character (expandable by daisy-chaining) internal line buffer storage. Standard are a 10, 12 or 18 characters/inch variable character density command, 2-color selectable print command, forward/backward printing command, and horizontal and vertical independently expanded print command. The CY-480 provides graphics capability and includes a "flip-print" operating mode for 180° viewing. Ready lines provide full asynchronous communications with handshaking.

Low price! \$35 a single unit!

and teachers. Such a system would truly support structured programming. Current practice does not support such activity. We are forced to submit character strings to our language systems, even though our methodology tells us to compose in terms of structure. Until that disparity is resolved we should expect little improvement in the software problem.

Most programming languages do very little to reinforce the creative process of algorithm discovery and creation. They are more concerned with the *execution* of already constructed algorithms. This is a natural outgrowth of their ancestry: a numerical computation era in which the emphasis was placed on minimizing computer time at the expense of programmer time. Also, the programming problems of that day involved the transcription of well-specified numerical algorithms into an equally precise programming language. Times and economics have changed. The problems are more complex and no longer as well-specified as those of numerical analysis. Now computers are cheap and programmers are expensive; we need techniques to speed the development of correct programs. Certainly the verification efforts are aimed in this direction, but verification typically is an after-the-fact reconciliation of a completed algorithm with some descriptive specification of its behavior. We need languages that support the creative and exploratory phases of program development. Of course, one may question this. In the Computing Surveys, Wirth writes:

... It is therefore entirely possible that in the future a more interactive mode of operation between compiler and programmer will emerge, at least for the very sophisticated professional. The purpose of this interaction would not, however, be the development of an algorithm or the debugging of a program, but rather its improvement under invariance of correctness. [Wirth's emphasis].

I most definitely agree with the emphatic phrase; we must develop such program transformation systems. However, it is equally important to improve the program development phase.

Exploratory programming, which is the hallmark of artificial intelligence and which, to a very large extent, occurs in the creative stages of any programming task, is best done with an untyped interactive language like LISP. Strong typed languages like Pascal only confuse and obfuscate the formulative stages.

LISP's basic unit is an expression, meaning

That's right. The famous Computalker CT-1 Speech Synthesizer that produces highly-intelligible natural sounding speech can now be installed on your TRS-80.

Completely self-contained, the Model CT-1T comes with its own chassis and power supply, on-board audio amplifier (2 Watts), CSR1 software, and interconnect cable. The CT-1T comes with complete documentation and is avail-

able on either 5 1/4 inch diskette or cassette. TRS-80 Level II and 16K words memory required, 32K words recommended.

that every LISP construct computes a value. LISP tends to emphasize the applicative nature of algorithms, using "function application" as its basic computational notation and using recursion to express the control aspects of the process; recent research has indicated that many common recursive schemes can be *executed* in an iterative fashion. That is, the evaluation mechanism need not involve the usual stack oriented overhead. One should not confuse the recursive notation with the evaluation mechanism.

The basic unit of Pascal is a statement, rather than an expression. That is, Pascal's units tend to be executed for *effect* rather than *value*. It is interesting that John Backus, the "father" of FORTRAN, has spent considerable time in recent years studying and advocating applicative languages, turning from the more traditional imperative, statement oriented languages like FORTRAN, ALGOL, and Pascal. In his Turing lecture, Backus writes:

This world of statements is a disorderly one, with few useful mathematical properties. Structured programming can be seen as a modest effort to introduce some order into this chaotic world, but it accomplishes little in attacking the fundamental problems created by the word-at-a-time von Neumann style of programming, with its primitive use of loops, subscripts, and branching flow of control.

Of course things are not all that black and white. Pascal has applicative aspects and LISP has imperative aspects. The difference is again one of emphasis and philosophy: the expression versus the statement. The difference has a mighty influence on the language design: expressions lead to calculator-like interactions; statements lead to computer-like programs. Wirth, in the Computing Surveys, writes:

We must recognize the strong and undeniable influence that our language exerts on our way of thinking, and in fact defines and delimits the abstract space in which we can formulate—give form to—our thoughts.

Computing Attitudes

That is a critical point, true in natural language as well as in programming languages. In fact, the problem goes deeper than programming language. One's attitude about computation is deeply connected with the human interface problem. Those who

OUR BOARDS WON'T LEAVE YOU BORED.

By and large, computer boards aren't the most exciting things in the world—but Mullen boards are an exception.

The **Extender Board Kit** has a logic probe that lets you know what's going on in your circuit. And if you get bored with that, there's a general purpose kluge board area where you can implement custom testing jigs. Still not enough? Hook a scope probe on to the specially designed edge connectors and check out the logic patterns. And if all that fails, maybe the low price will get you excited. **\$39 per kit.**

The **Controller Board Kit** is an intelligent switching system that listens to the world through 8 opto-isolator inputs, confers with the computer, and then issues open/close instructions to 8 reed relays. If you get tired of low power applications, high power AC modules are available. Each kit includes applications notes and an onboard self-tester. **\$99 per kit.**

For some people, the fun stops once you've put a board in your computer. With a Mullen board, the fun's just beginning.

systems, inc.

Boards DO Something

If your system needs to know what time it is, our CL2400 is the board for you. The present time in hours, minutes, and seconds is always available for input, and is continuously updated by the highly accurate 60 Hz power line frequency. Need periodic interrupts? The CL2400 can do that, too, at any of 6 rates. Reference manual with BASIC and assembly language software examples included.

CL2400 Real Time Clock
\$98/Kit \$135/Assembled

If your system needs on/off control of lights, motors, appliances, etc., our PC3200 System components are for you. Control boards allow one I/O port to control 32 (PC3232) or 16 (PC3216) external Power Control Units, such as the PC3202 which controls 120 VAC loads to 400 Watts. Optically isolated, low voltage, current-limited control lines are standard in this growing product line.

(formerly comptek)

grew up with batch oriented computation have a quite different frame of reference from that of a person who has experienced truly interactive access.

These attitudes permeate the whole computing approach. If one is to interact with a calculator, then we must expect to present expressions and receive values; that implies an immediacy which is antithetical to type structures. So too is interactive design; the interactive creation and running of partially specified programs is difficult to reconcile with language processors that expect total information about all program segments and identifiers.

By now many of you are sure that I am preaching total heresy, advocating a return to the old days of hack and patch programming. I am definitely not. Rather, I am advocating the development of programming systems that incorporate the ideas of structured stepwise development of programs—systems in which the interactive *development* is as flexibly supported as the interactive *debugging* of modern LISP systems. We must do for programming what the page oriented display has done for editing. But such systems are only half the software problem. We must dramatically improve the way people think about programming. Computer programming is probably the most difficult and challenging enterprise mankind has ever undertaken. Until programming methodologies are supported by the programming tools, and until programmers are expected to spend as much time perfecting their craft as professional engineers and poets, we should expect little improvement in software quality.

We must put a stronger emphasis on the education of programmers, rather than restrict the expressive powers of the languages. Consider the tools of a more traditional craftsman: in the hands of an amateur those tools can be deadly, whereas the craftsman can develop exquisite objects. We do not propose that all tools be dulled appropriately so that the amateurs cannot do themselves injury! We educate them in the proper use of, and respect for, the instruments and expect that the craftsman's tool remain sharp. The emphasis is properly placed on the individual. Do not confuse education with the mass-merchandizing of armies of programmers whose competence is sealed in a cautious, uncreative world of dull tools. The artificial intelligence community is the craft of the tool builder; their tools are the sharpest and most incisive of the computer field. It is this kind of tool which should appeal to the personal computer person. It is not the elegance of BASIC which has made it the standard personal

computer language; it is BASIC's interactive nature, allowing quick experimentation with programming ideas, that accounts for its longevity. This interactive flavor can be grafted onto a Pascal-like language, but it is much more difficult to do this successfully. In the process one either compromises the tenets of the language (extensions) or compromises the resulting system.

"Wild West" Computing

The essence of personalized computing has been sort of the "wild west" attitude: open, undisciplined, but creative and lusty as hell. You are a very healthy sign; today, a modest personal computer has more power and flexibility than that available in a professional installation 20 years ago. Each of you has molded your system according to your desires and economic constraints. But freedom is expensive; systems and programs become one of a kind. Enter compatibility and, unless you are careful, exit individuality. Clearly these problems are not solely the province of personal computing; the manufacturers feel the same pressures. So the real question is: can we bring discipline and order to programming without curtailing the creativity?

Personal computer users need not give up the interactiveness of BASIC to gain the structure and portability which Pascal is advertising; LISP offers both. BASIC's longevity, indeed strength, lies in its "friendliness." That is a critical ingredient of an interactive programming language. I guarantee that if BASIC were available only in the traditional batch oriented environment, its popularity as a personal computer language would not have occurred. Similarly with LISP or Pascal. That is, it is the total environment in which a language is situated that is important. The UCSD experience with Pascal illustrates this point well. The real question then is: can we do better?

LISP is *not* a special purpose list processing language. A modern LISP system has more flexible data handling facilities than other more recent languages. For example, MACLISP's data types include arbitrary precision numbers, very flexible record structures (called property lists), strings, arrays, list structure, and even procedures. One attribute which leads to LISP's elegance and economy of expression is that all of these data types are available as values of programming constructs. Thus LISP procedures may take procedures as values, return procedures as values, or create arrays which are returned as value.

Lest you suspect that such generality implies inefficiency, note that LISP has been used as the systems programming language for the MIT LISP machine. All system software is written in LISP even to the level of the algorithms that place the characters on the screen. Even the micro-code is written in LISP. LISP compilers can be as good as those of any other language. In one experiment, the MACLISP compiler was tested against a FORTRAN compiler on some purely numerical examples. The LISP compiler's code was better both in terms of space and time.

Might not such generality lead to sloppy programming techniques? Note again that a language is a tool, and is only as effective as its user. I would rather sharpen the user than dull the tool. In terms of user aids, LISP excels. A modern LISP system is an integrated programming environment incorporating editors, debuggers, and compilers. Some LISP packages include sophisticated error recovery modules, allowing the user to undo computations or explore alternative computations. The integration of these "programmer's assistants" with modern display techniques has begun. The results are quite impressive. The flexibility of these systems is due in large part to LISP's unique representation of programs as data structures. As a result, it is easy to write programs which manipulate programs. Note that language editors, debuggers, compilers, and program transformations systems like those advocated by Wirth (above) all fall into this category.

One also hears dreadful rumors about LISP's syntax (Lots of Irritating Single Parentheses). First, the regularity of the notation and the simple syntax more than make up for any initial inconvenience. However, these syntactic difficulties can also be stifled directly. It is quite simple to supply LISP with an ALGOL like sugared input and output. Such parsers and unparsers are simple LISP programs.

The above discussion has hinted at a very important aspect of LISP: LISP is a machine language. In the traditional machine, instructions reside in memory locations just as data does. It is the access path of the processor that determines how the contents of a location are to be interpreted. Access by the program counter implies an instruction fetch; other access implies a data fetch—so too in LISP. Data and program are stored identically; both are presented to the machine in a simple syntax of lists. The LISP CPU (central processing unit), called *eval*, accesses LISP memory either to fetch code or data. Instead of the linear sequential representation of traditional ma-

chines, LISP has a tree-like storage scheme. One very exciting area of investigation involves architectures for LISP-like machines.

Finally, it is often assumed that LISP demands large expensive computers for its implementation. That, too, is not true: there are versions of LISP for the Z-80, 8080, 6800, F8, LSI-11, and even a version in BASIC. Certainly the machine size will limit the range of feasible applications; but that is true of any language. The new class of microcomputers is particularly exciting. They will open up many new areas—including artificial intelligence study—for the personal machine. The new machines will support very substantial implementations of LISP.

It is particularly important to influence the personal computer advocate now, given the growth in computing power and the cries for compatibility, discipline, and standardization. The DOD-1 language effort is but the latest manifestation of this attitude. I do not believe that this legislative approach is healthy. I believe that LISP offers a healthy alternative to the current choices of programming languages for personal computation. ■

Clubs and Newsletters

Southeastern Michigan Computer Organization Sponsors TRS-80 Group

SEMCO (the Southeastern Michigan Computer Organization) sponsors a TRS-80 special interest group for Radio Shack TRS-80 enthusiasts. Meetings are for the beginning hobbyist and computer expert alike. The main objective is to share ideas on programming, troubleshooting and new or compatible TRS-80 products. This group meets the first Saturday of every month from 6 to 9 PM. The location is the Bryant Branch Library, Michigan Av and Mason St, Dearborn MI 48124.

Northwest Computer Society

The Seattle chapter of the Northwest Computer Society meets at the Pacific Science Center on the first and third Thursday of each month at 7:30 PM. The first meeting of the month is normally held in room 200 on the east side of Science Center Court. This meeting usually features a formal presentation by a speaker or speakers. The second meeting of the month is normally held in the math room at the southeast corner of Science Center Court. This meeting is usually more informal with freewheeling discussion and problem

solving. Call the recorded information line at (206) 284-6109 or write to POB 4193, Seattle WA 98104.

South Florida Computer Group

The South Florida Computer Group has two chapters, one in Miami and the other in Ft Lauderdale. Members can attend meetings at both chapters and visitors are welcome. The Miami chapter meets the first Monday of every month at the Papanicolaou Cancer Research Institute, 1155 NW 14 St, Miami. The Ft Lauderdale chapter meets the second Tuesday of every month at the Social Annex Building, Holiday Park (behind the Parker Playhouse). Both chapters have a \$5 a year membership fee which includes their monthly newsletter, *I/O*. For more information about this group, write to Robert Lief, Papanicolaou Cancer Research Institute, 1155 NW 14 St, Miami FL 33136.

Australian 9900 Users Group

The Australian 9900 Users Group is a relatively new club concerned with the 9900 family of devices and applications for process control and business data processing. They have both Texas Instruments and Technico equipped members and would welcome contact with overseas correspondents. Presently, they do not have meetings but operate by direct contact or by correspondence between members. Contact Barry Day, 43a Osborne Rd, Lane Cv, NSW 2066, AUSTRALIA.

Melbourne Australia Computer Club

We have heard from Andrew Stewart, correspondence secretary of MICOM (the Microcomputer Club of Melbourne). The club meets the third Saturday of every month at Railway Modellers' Hall, Willis St, Glen Iris, Victoria. The dues are \$7.50 per year, which includes a monthly newsletter and quarterly magazine. MICOM can be contacted at POB 60, Cantebury, Victoria 3126, AUSTRALIA.

North London Hobby Computer Club

A press release has come our way informing us of a recent meeting of the North London Hobby Computer Club. At this particular meeting, held at the Polytechnic of North London, over 200 members and guests listened to a talk given on the present situation in personal computing. After the talk, three user groups were formed: a PET user group; a business user group; and another group of individuals interested in homebrew activities. The club is planning a series of lectures, and hopes to publish a regular monthly newsletter. For more information, contact Robin Bradbeer, Dept of Electronics and Communications Engineering, Polytechnic of North London, Holloway Rd, London N7 8DB, ENGLAND.

"Manufacturers of Information Processing Supplies"

Attention: TDL Users

An exchange of information among users of TDL (Technical Design Labs) equipment and software is being started by Dr John R Cameron, POB 1517, Palo Alto CA 94301. If you would like to correspond with others who have similar interests, send descriptions of any and all Z-80/TDL related hardware and software to Dr Cameron. He asks that you enclose a brief summary (typed, single spaced) of your offerings and wishes, with your return address. Whatever material you wish to disseminate may be enclosed, or give prices and availability for commercial offerings. A users survey is also being compiled, so you may wish to describe your system and its applications. For copies of other users' summaries and information of general interest, send \$3 to Dr Cameron at the above address.

New Computer Group in Battle Creek MI Area

Called the Battle Creek Area Microcomputer Club, this group consists largely, but not exclusively, of TRS-80 owners. Meetings are on alternate Thursdays at 7 PM and include software swapping, hardware topics, tutorials, etc. Both professionals and beginners are welcome. For detailed information, contact Jeff Stanton, 8587 Q Dr N, Battle Creek MI 49017.

Pittsburgh Area Computer Club Members Compete for Monthly Babbage Award

PACC (the Pittsburgh Area Computer Club) is currently meeting every third Sunday at 11 AM in the community room of the Northway Mall. They normally have a 2 hour general session, followed by a formal meeting with a speaker. This in turn is followed by another general session in which the various user groups meet. During the formal meeting the monthly Babbage is awarded to the "best in its class." Members and guests are invited to bring their systems, share their ideas and vie for the Babbage prize. Contact PACC, 400 Smithfield St, Pittsburgh PA 15222.

Space Coast Microcomputer Club Celebrates Second Birthday

Ray Lockwood, president of the Space Coast Microcomputer Club, called us with information about his computer group. The club recently celebrated its second birthday and boasts a membership of approximately 100. They meet every fourth Thursday at 7:30 PM at the Merritt Island Public Library, 315 Inlet Av, Merritt Island FL. The membership fee of \$5 includes the club's newsletter. Ray tells us there is club interest, but not exclusively, in 8080 and Z-80 systems. If you wish further information, he can be reached at (305) 452-2159. ■

AIM 65. Only \$375.

Get a head start with computers the easy, inexpensive way with Rockwell's AIM 65.

For learning, designing, work or just fun, the R6500 Advanced Interactive Microcomputer (AIM 65) offers features you won't find on other comparably priced systems.

- Alphanumeric 20-Column Thermal Printer for Hard Copy Listing
- Alphanumeric 20-Character Display

Call for Papers

The 17th annual meeting of the Association of Computational Linguistics will be held August 11 thru 12, 1979, on the campus of the University of California, San Diego, at La Jolla CA. Papers are being solicited on linguistically and computationally significant topics, including theoretical and methodological problems of computational linguistics (eg: mathematical foundations, software tools); computational semantics (eg: linguistic semantics, deductive logic, artificial intelligence); automatic syntactic parsing and synthesis of natural languages; computational lexicography and stylistics (eg: concordances and statistical studies); speech recognition and synthesis, graphemics (ie: character recognition); automated terminology dictionaries, machine translation and machine aided translation. Authors wishing to present a paper should submit five copies of an extended abstract (not to exceed 1000 words) by April 1 1979 to: Dr Norman

Sondheimer, Sperry Univac, POB 500, M S 2G3, Blue Bell PA 19424, (215) 542-5896. ■

Boston is Having a Huge Small Computer Show

Hynes Auditorium in Boston is the site of the Northeast Computer Show. The show originally scheduled to be held April 6, 7 and 8, 1979 has been changed to September 28, 29 and 30, 1979. The Northeast Computer Show will be a total spectrum presentation for the trade and public. There will be two separate sections to the show: a small business system section and a personal computing section.

The personal computing section will feature microcomputers, small computer systems, business opportunities, electronic and video games, career and employment opportunities, education exhibits, free seminars and lectures. Exhibitors will display the latest in personal computing hardware and software, computerized music synthesizers, computer amusements, computer generated art, graphics, and animation. Dozens of free lectures and seminars will be given by internationally recognized speakers for all categories and levels of enthusiasts including introductory classes.

The admission fees to the show are \$5 for adults, \$4 for college and high school students. For more information write or call: Northeast Exposition, POB 678, Brookline Village MA 02147, (617) 522-4467. ■

Tektronix Microprocessor Design and Development Lab Workshops

Tektronix Inc is offering a series of microprocessor design and development lab workshops. Two different types of workshops are available: one lasts five days for those who want exposure to basic microprocessor design and organization, as well as experience in design development and testing. The other is a 3 day workshop for those already experienced in microprocessor design who wish more intensive training in developing and testing a design using the Tektronix 8002 Microprocessor Development Lab. Both workshops will provide a practical, hands-on, results oriented learning experience. The purpose of the workshop is to help the attendee grow as a professional designer. For a complete listing of dates and locations, write to Tektronix Inc, POB 500, Beaverton OR 97077. ■

International Date Standard

Software system writers may be interested in the international standard for writing numeric dates. In 1971 the International Organization for Standardization adopted Recommendation 2014, which provides for a system of descending order when writing numeric dates on any letter or document. If numbers only are used, the first day of July in the year 1979 should be written 1979-07-01. The hyphen is preferred as a separator, rather than the period, slant, or space.

If the month is given in alphabetic form, one can write the date in any order (eg: 1 July 1979, July 1 1979, or 1979 July 1). No ambiguity results when a 4 character year field is used.

A related document, Recommendation 2015, sets up a standard for the numbering of weeks. It is recommended that for business and commercial purposes, Monday be regarded as the first day of the week. Furthermore, the week should always be seven days in length. A week which is divided by the turn of the year should be attached to the year containing a majority of days in that week.

ANSI (the American National Standards Institute) is the member organization representing the United States. Correspondence should be directed to ANSI, 1430 Broadway, New York NY 10018. ■

Sargon Reproduced

We have been informed by Matt Mihovich of the Hayden Book Company

Add-In Associative Memory for the S-100 bus

Discussed and dreamed about by computer scientists for years, Content-Addressable Memory (CAM) is now here at an affordable price. CAMs have been so costly to build that few have actually been produced. Now Semionics has developed a simplified design, lowering the cost by two orders of magnitude. This new memory is called Recognition Memory (REM), since (like the human brain) it can recognize words, patterns, etc.

Adding a REM board to an ordinary microcomputer converts it into a very powerful machine known as a Content-Addressable Parallel Processor (CAPP).

Features:

- 4K bytes per board
- Static — no refresh needed
- Can be used as ordinary RAM or as CAM
- RAM access time: 200 ns
- CAM access time: 4 μ s
- Multiwrite — writing into multiple locations with one instruction
- Masking — for individual bit access
- Multiple REM boards accessed in parallel

Adds 17 associative memory functions to instruction set of Z-80 or 8080.

Applications:

- Pattern Recognition • Information Retrieval • Compiling & Interpreting
- Natural Language Processing • Code Compression • Artificial Intelligence

Price: \$325

4K firmware package of REM routines: \$80

that the Sargon chess program described in recent issues of BYTE is no longer directly available from the authors. It is now marketed by the Hayden Book Company in book and tape (TRS-80, Level II) formats. The book retails for \$14.95 and the tape for \$19.95. Contact Hayden at 50 Essex St, Rochelle Park NJ 07662.■

New Computer Chess Champion

At the Computer Chess Championship held at the 1978 ACM (Association for Computing Machinery) meeting this past December, a new champion emerged from the Swiss system tournament. The program *Belle*, developed at Bell Laboratories, edged out defender Chess 4.7, the program developed by Slate and Atkin at Northwestern University. The Belle program runs on a Digital Equipment Corp PDP-11 with special hardware to generate moves, and a new device to evaluate positions using high speed hardware.

Of interest to microcomputer users is the relatively good performance of the Sargon program, written by Dan and Kathe Spracklen. It managed a good enough performance for a tie for third place, although the Swiss system leaves controversy concerning its exact ability.

Still waiting in the wings is Slate and Atkin's newest effort, Chess 5.0. At this writing, this version is not ready for competition. The rewritten program uses the venerable FORTRAN language.■

Association for Women in Computing

It has been announced that the AWC (Association for Women in Computing) was founded on December 5 1978 in Washington DC. The purposes of AWC are:

- to promote communication among women in computing;
- to further the professional development and advancement of women in computing;
- to promote the education of women and girls in computing.

Membership in AWC is open to all persons interested in the purposes of the association regardless of sex, race, religion, or national origin. To obtain further information and/or a membership application, contact Anita Cochran, 5A137 Bell Laboratories, Murray Hill NJ 07974.■

Automated Shopping List

During the past Christmas season, an interesting computer application was demonstrated at the Mall of New Hampshire in Manchester. The Digital Equipment Corp retail store there set up three DECstation 78 computer systems for use by shoppers. Each system executed a

program for an automated shopping list. Each user answered four questions about a gift recipient, and the computer selected appropriate gifts from a data base contained on floppy disks. The selections were printed out in the form of a list of 20 suggestions.

The data base was created from gift selections submitted by the various stores in the mall in each of the several categories. An exemplar of a gift suggestion list is reproduced here. The list is specified as being appropriate for a

female, 18 years of age or older, in the price range of \$20 to \$50, in the category of general presents.

It is estimated that over 1000 people per day used the system. The DEC store has received many inquiries about the system, and no doubt many such systems will appear in other locations. The program used in the system was written in the DIBOL language. The processor unit in the DECstation 78 is a microcomputer version of the venerable PDP-8.■

MERRY CHRISTMAS FROM THE DIGITAL STORE!
OUR COMPUTER HAS PROCESSED YOUR DATA AND SUGGESTS THE FOLLOWING GIFTS:

THANK YOU FOR SHOPPING AT THE MALL OF NEW HAMPSHIRE

HOBBYISTS! ENGINEERS! TECHNICIANS! STUDENTS!

Write and run machine language programs at home, display video graphics on your TV set and design microprocessor circuits—the very first night—even if you've never used a computer before!

ELF II featuring RCA COSMAC microprocessor/mini-COMPUTER \$99.95

Stop reading about computers and get your hands on one! With a \$99.95 ELF II and our *Short Course* by Tom Pittman, you master computers in no time at all! ELF II demonstrates all 91 commands an RCA 1802 can execute and the *Short Course* quickly teaches you to use each of the 1802's capabilities. ELF II also displays graphics on any TV set, including an exciting new target/missile gun game! Add-ons are among the most advanced available anywhere. You get massive computing potential. No wonder IEEE chapters, universities and major corporations all use ELF II to train engineers and students! Kit is easily assembled in a single evening and you may still have time to run your first programs before going to bed!

SEND TODAY!

NOW AVAILABLE FOR ELF II—

- Tom Pittman's *Short Course On Microprocessor & Computer Programming* teaches you just about everything there is to know about ELF II or any RCA 1802 computer. Written in non-technical language, it's a learning breakthrough for engineers and laymen alike. \$5.00 postpaid!
- Deluxe metal cabinet with plexiglas dust cover for ELF II. \$29.95 plus \$2.50 p&h.
- ELF II connects to the video input of your TV set. If you prefer to use your antenna terminals, order **RF Modulator**, \$8.95 postpaid.
- **GIANT BOARD™** kit with cassette I/O, RS 232-C/TTY I/O, 8-bit P I/O, decoders for 14 separate I/O instructions and a system monitor/editor. \$39.95 plus \$2 p&h.
- Kluge (Prototype) Board accepts up to 36 IC's. \$17.00 plus \$1 p&h.
- 4k Static RAM kit. Addressable to any 4k page to 64k. \$89.95 plus \$3 p&h.
- Gold plated 86-pin connectors (one required for each plug-in board). \$5.70 postpaid.
- Professional ASCII Keyboard kit with 128 ASCII upper/lower case set, 96 printable characters, onboard regulator, parity, logic selection and choice of 4 handshaking signals to mate with almost any computer. \$64.95 plus \$2 p&h.

- Deluxe metal cabinet for ASCII Keyboard, \$19.95 plus \$2.50 p&h.
- ELF II Tiny BASIC on cassette tape. Commands include SAVE, LOAD, =X, +, (,), 26 variables A-Z, LET, IF/THEN, INPUT, PRINT, GO TO, GO SUB, RETURN, END, REM, CLEAR, LIST, RUN, PLOT, PEEK, POKE. Comes fully documented and includes alphanumeric generator required to display alphanumeric characters directly on your TV screen without additional hardware. Also plays tick-tack-toe plus a drawing game that uses ELF II's hex keypad as a joystick. 4k memory required. \$14.95 postpaid.
- Tom Pittman's *Short Course on Tiny BASIC* for ELF II, \$5 postpaid.
- Expansion Power Supply (required when adding 4k RAM). \$34.95 plus \$2 p&h.
- ELF-BUG™ Deluxe System Monitor on cassette tape. Allows displaying the contents of all registers on your TV at any point in your program. Also displays 24 bytes of memory with full addresses, blinking cursor and auto scrolling. A must for the serious programmer! \$14.95 postpaid.
- Coming Soon: A-D, D-A Converter, Light Pen, Controller Board, Color Graphics & Music System...and more!

Call or write for wired prices!

Continued from page 10

I am just reaching the point where I can remember that TH is a search mode and ZA is the number of characters in a word. This is particularly regrettable in a program with avowedly pedagogical purposes. I shall refrain from belaboring the similar confusion caused by the program's use of GOTOs.

Finally, I am sorry that the authors did not comment generally on the memory requirements for the program, its performance, and the question of high versus low level languages for competitive chess programs. Still, it is an exciting series and I look forward to adapting the program when my Western Digital Microengine arrives.

ATTENTION ATARI EXPERTS

I am getting started in home computing. I have an Atari video computer with interchangeable game cartridges and controls. Is it possible to modify this so that I can write small programs on it? If anyone has done this, I would appreciate being sent some directions on how to do it. (I have some experience in putting electronic kits together.)

If these modifications are not feasible, does there exist a plug-in cartridge for playing chess? It seems to me that the 12 key keyboard or the 10 pin connector could be made to handle chess functions. I would appreciate help and advice from your readers.

DIGICAST: A CORRECTION AND AN OPINION

I would like to make a couple of corrections to the otherwise fine article by A I Halsema regarding "The Digicast System" in January 1979 BYTE, page 100.

- The explanation offered for the functioning of the standard FM Multiplex transmission and reception system needs clarification. What is commonly referred to as the stereo pilot signal is a signal sent to the FM tuner at 19 kHz from center frequency, which acts as an on-off switch for the tuner's demultiplexing section. In the presence of the 19 kHz pilot, the tuner will attempt to combine the difference signal being sent in the 38 kHz band with the

summary monaural signal to derive two channels [algebraically, $(L + R) \times (L - R) = (L^2 - R^2)$]; in the absence of the pilot, the monaural signal is fed to both preamplifier channels.

- I highly doubt that, in practice, one could realize a full 6 M bit data rate on a UHF television channel where the full channel bandwidth is only 6 MHz total. The realities of broadcast transmission and reception would probably yield a service operating at less than half this frequency (I would guess 2.0-2.5 M bps tops).

Neil D Weiser

Stamford CT 06902

CAN OUR READERS HELP?

I would appreciate information concerning any suppliers of an IBM compatible Magnetic Card II reader which may be interfaced to a microcomputer which uses the S-100 bus.

Ray Menzies
3/545 St Kilda Rd
Melbourne 3004
AUSTRALIA

Any BYTE reader with appropriate information is requested to correspond with Mr Menzies.

TEXT EDITOR

Your editorial "On the Virtues of Writing Editors" (November 1978 BYTE, page 6) prompted this letter to the editor. It seems that we have been reinventing the same wheel. I began writing my text editor about nine months ago—after becoming sufficiently frustrated with the Teletype-oriented editor purchased when I first got my system running. I have actually intended to write this letter since I read your earlier editorial asking for a better text processing system. However, I have been busy completing my doctorate during the period when the program was being developed so other things have also occupied my time. Many of your ideas were incorporated into my program. Here is a description of my editor.

Videowriter is a video display oriented text editor. I wrote it for the most common hobbyist systems (16 lines of 64 characters) but it is easily modified for other page lengths, and can be modified for other page widths (it is very easily modified for the Sorcerer size screen). It is an expandable program designed to have extra features added on as desired by the user. A complex split screen video driver for a memory mapped video display and a keyboard input routine using three flashing cursors are incorporated into Videowriter so that support software external to the program is not needed.

The screen is divided into a text display area and a command and message

6800 PERFORMANCE PRODUCTS FROM MICROWARE

A/BASIC COMPILER Unmatched for speed, versatility and efficiency, generates pure 6800 machine language from BASIC source. Fast integer math, strings, logical and array operations. Output is ROMable and requires no run-time package. Cassette version requires RT/68 and 8K RAM. Disk versions require 12K and have complete disk I/O statements plus other extensions.

Cassette Version — A/BASIC V1.0C \$ 65.00
SWTPC Miniflex — A/BASIC V2.1F \$150.00
SSB DOS-68 — A/BASIC V2.1S \$150.00

RT/68 OPERATING SYSTEM Compatible MIKBUG replacement ROM with expanded, improved monitor plus real-time multiprogramming executive. 1000's in use since 1976.

RT/68 MX on 6830 ROM (Mikbug pin compatible) \$ 55.00
RT/68 MXP on 2708 ROM (EPROM pin compatible) \$ 55.00

6800 CHESS challenging chess program, two difficulty levels. Runs in 8K RAM. Mikbug-compatible object plus A/BASIC source. Specify cassette, SSB or SWTPC minidisk.

CHESS V1.0 \$ 50.00

DR. ELIZA 6800 version of famous MIT artificial intelligence program. Computer as psychoanalyst communicates in plain English dialog. Mikbug compatible object plus A/BASIC source. Specify cassette, SSB or SWTPC minidisk.

ELIZA 1.0 \$ 30.00

AS-1 A/D INTERFACE. Eight channel, 8-bit high speed A/D system for SS-50 I/O buss. Assembled. \$115.00

AS-4 D/A INTERFACE Four channel 8-bit ultra fast D/A system for SS-50 I/O buss. Independent isolated Z-axis strobe output for oscilloscope or plotter graphics. Assembled. \$195.00

U.S. orders add \$2 for shipping. VISA and MASTERCHARGE welcome. Call or write for free 6800/6809 catalog.

display area. The text area is the bottom 13 lines of the screen. A flashing cursor indicates the position at which the next operation in the text buffer will occur. This cursor changes to different figures for either the text input mode or the command mode so the operator can tell at a glance which mode is in effect. The cursor can always be moved at will—left, right, up, and down. Left and right movement stop at the end of the line, and the cursor can move to any of the 13 text lines displayed. If the operator attempts to move the cursor off the top or bottom of the screen, text is scrolled onto the screen (scroll down or scroll up) form the text buffer. A direct one-to-one correspondence is always maintained between the screen text cursor position and the text buffer pointer position. To illustrate the use of the cursor, imagine that you are entering text and notice a misspelled word several lines up on the page. Without changing operating modes, move the cursor up to the line containing the error and then over to the wrong letter, positioning the flashing cursor over the error. Touching the delete key (or any other key so defined at assembly) removes the letter and the line beyond the cursor moves back one place. Now simply type in the letter or letters desired. The line moves to the right to make room. If the line becomes too long for the screen

width it is split into two parts at the cursor position, and you continue entering on the same line. If you come to the end of the screen line an automatic carriage return and line feed is executed. If you were part way through a word at the end of the line the entire word will be entered on the next text line, and you simply keep typing. When a letter is entered in the last position on the screen line the cursor wraps around to the start of the next line to signify that that is where the next letter will go. A cursor-left from this "65th" position will move back up to the last line entered just as if the cursor was actually on the same line (in the text buffer it is). The cursor *always* indicates where the next insertion or deletion will occur. The operator does not need to enter a carriage return at the end of the line—this is done automatically.

Text lines in the text buffer are terminated by a single carriage return character. Actual line length varies from the single carriage return up to 64 text characters and a carriage return. This buffer arrangement is the most memory conservative arrangement that I could easily implement. Any byte (hexadecimal 00 to FF) can be entered into the text buffer.

Videowriter features user set, variable tab stops that work exactly like tab stops on a typewriter. 16 tab stops are

allowed—and they can be set at any line position.

The top line of the screen is used for messages from the editor to the operator. If more tabs are entered into a line than there are tab stops set in the tab stop buffer the message TAB STOP NOT SET appears in the upper left corner of the screen and the system's bell is sounded. Similar messages announce other user errors and undefined conditions.

The command mode of operation allows the operator to manipulate the text through the execution of command strings. Commands are all single letter entries (upper or lower case) made on the third line of the screen. Command characters do not have to be separated by a delimiter, but a delimiter \$ is used to separate groups of commands. Each group delimited by a \$ will be repeated as a loop according to the number preceding the group on the command line. For example:

```
9999asdf$23ERT$h$121K$$
```

will be interpreted in the following way.

1. Execute the commands A, S, D, and F; and repeat 9999 times.
2. Do E, R, T 23 times.
3. Do one H; execute L and K commands.
4. Stop.

After the command string is entered on line 3, the two dollar signs \$\$ signal the start of execution. The line is first moved up to line 2, and then the commands are actually read from the video memory and executed. If the operator makes an error another command string can be entered on line 3 with the previous string still visible on line 2. Existing line 2 command strings can be repeated, and line 3 command entries can be deleted singly or the entire line can be erased. The command line cursor indicates where the next command line entry will go. A text cursor indicates where the next command will have effect in the text buffer. For example, the delete command will delete characters starting at the current text cursor position.

There are two types of commands. The 26 single letter commands are reserved for use on the command line as described above. These commands are decoded in sequence and a vector is found in a table. The user can place any vector in this table and the editor will then call the user's routine. A number of immediate commands are implemented using the set of ASCII control characters. A control E initiates the text enter mode. A control C halts execution of any command mode string (if the user has written it into the routine!) and returns to the command mode with a *BREAK* message and a bell. Control R deletes the entire line 3 command string entry. A control X returns to the monitor or operating system. The control Z command causes the next character

HAVING TROUBLE LEARNING BASIC?

STEP BY STEP is an interactive computer course in BASIC that's easy even for beginners. Program Design has developed a logical, structured approach that really works. At the end of STEP BY STEP, you'll be writing programs using all important BASIC commands.

AVAILABLE FOR TRS-80 LEVELS I & II, PET, AND APPLE II

STEP BY STEP:

- presents material in small steps
- provides guided programming practice in each lesson
- tests your progress after each lesson
- teaches actual program writing, not just terms
- is suitable for anyone from junior high up, regardless of math background

10 lessons with quizzes, plus final test 3 cassettes
64 page Workbook \$39.95 plus \$2.00 shipping

P.D.I. has many other educational programs too. Available at your computer store. Or order directly from us.

entered from the keyboard to be entered into the text buffer, regardless of any assigned function of the character.

Videowriter is constructed in two parts. The core program does the house-keeping for the features described above (except for the delete command). None of the 26 single letter commands is used by the core program. (Control T initiates the tab set or clear routine.) All of the immediate commands are processed by the core program. Text buffer entry or delete, cursor positioning, screen scrolling, and keyboard entry are managed by the core. Decoding of the 26 single letter commands, command line execution and loop control is done by the core, and control is passed to the vector in the command vector lookup table. Undefined commands return control to the command processing routine.

The other half of Videowriter is a user expandable set of extension routines vectored to by the core program. The user's routine does not need to save any registers or the stack pointer position, but the address on the stack when the extension routine is called must be saved. This is the return address to the command processor. Input and output routines are obvious candidates for the extension routines, since these routines must be tailored to the user's individual disk or tape system. The normal editor functions to search for strings, substitute strings, delete text blocks, copy blocks, move blocks, etc. are implemented in the extension routines.

The character delete routine is a good example. The single letter D or d causes one character to be deleted from the text buffer. D100 will delete a block of 100 characters. 100D will delete 100 characters one at a time, with the results displayed on the screen after each deletion. 30D100 will delete 30 blocks of 100 characters each. The D\ command simply searches from the current pointer position toward the end of the text, looking for a special stop character in the text buffer. Text is then deleted from the cursor to the stop flag, or to the end of text if no flag is set.

The O\ command outputs from the buffer from the cursor to the stop flag or end of text, and the O command saves the entire buffer. The move command moves a block, from the cursor to the stop flag, to a position marked in the buffer by a special flag. The function requires only one byte more than the original buffer size, regardless of the size of the block moved. Copy works similarly except that the original block is not destroyed. It appears that there will be about ten unused command vector positions left in the command vector table for the addition of user functions. These could be used to implement text output processing extensions.

It is my intention that Videowriter be used by simply pointing the cursor and then performing the function doing it without having to count lines or places, etc. All changes to the text buffer are displayed. It has always seemed obvious to me that this is an absolute

requirement for a text editor, but I have never seen another program that does as much for the operator as Videowriter. Since no one else had what I considered to be a "decent" editor, I wrote it myself!

Of course, the current implementation of Videowriter doesn't satisfy me completely. It has one major drawback which must be fixed—the more text between the cursor position and the end of text the slower it runs (block transfers are slow). If text is being entered with 16 K bytes of text following the cursor, a fast typist can enter characters faster than Videowriter can put them into the buffer. This will be fixed by using a line input buffer so that no more than 64 characters will be moved at each entry until the line is full. Nested command loops will be added, probably before you receive this letter. This will allow true macrocommand loops to be entered and executed.

Only two simple routines are needed to allow nested command loops, with no changes to the current command processing scheme. Currently, only 9999 iterations of each loop are allowed, but this will be changed to allow 65535 passes. That should be enough to satisfy anyone! I want to add a display at the upper right corner of the screen to show the workspace remaining. The tab set and clear routine must be modified to

display the position number of each tab stop. And, finally, I eventually want to add a separate command buffer so that huge macrooperation can be executed. The command buffer contents will be saved and loaded just like the text buffer. These are all changes to the core program, and should take another month or two at the most.

Do you like it? Do you have any suggestions for further additions or modifications? If you do I would certainly appreciate your opinions. Of course it isn't complete (as I would like it) now, but it works—and, of course, I am using Videowriter to write this letter! Virtually all of the extensions need rewriting to speed them up. I forgot to mention one point: Videowriter was assembled in TDL's pseudo-8080-like, Z-80 mnemonics. Since most of the op codes are 8080 op codes, rewriting for the 8080 will be simplified. I have machine reproducible flow diagrams for all of Videowriter which are fairly compact—more so than flowcharts.

I will appreciate any comments. Videowriter will soon be running on several other systems so I can get other opinions.

Now available! Text Editor, Assembler, Disassembler and a new Video Display Board for ELF II!

The TEXT EDITOR gives you word processing ability and the ability to edit assembly language programs while displayed on your video monitor. Lines and characters may be quickly inserted, deleted or changed. (Add a printer and ELF II can type letters for you error free: plus insert names and addresses from your mailing list.)

ELF II's ASSEMBLER translates assembly language programs into hexadecimal machine code for ELF II use. The Assembler features mnemonic abbreviations for instructions (rather than numerical) so your programs are easier to read and debug.

ELF II's DISASSEMBLER takes machine code programs and produces assembly language source listings. This helps you better understand the programs you are working with so they become a bit easier to improve.

The new ELF II Video Display Board lets you generate a sharp professional 32 or 64 character by 18 line upper and lower case display on your screen or video monitor. Dramatically improving your unimproved \$59.95 ELF II. When you get into longer programs the Video Display Board is really a blessing!

Now Available • Text Editor, Assembler & Disassembler!

Featuring 1802 RCA COSMAC microprocessor/mini-COMPUTER INCLUDES VIDEO INTERFACE ONLY \$99.95

As Featured in POPULAR ELECTRONICS

power to solve "real world" problems that you would get from "famous name" computers selling for many times ELF II's low price. No wonder IEEE chapters, universities and major corporations are all ordering ELF II to train their personnel! Now you can order your ELF II direct from the factory with the coupon below.

DEALER INQUIRIES INVITED

What Is an Interrupt?

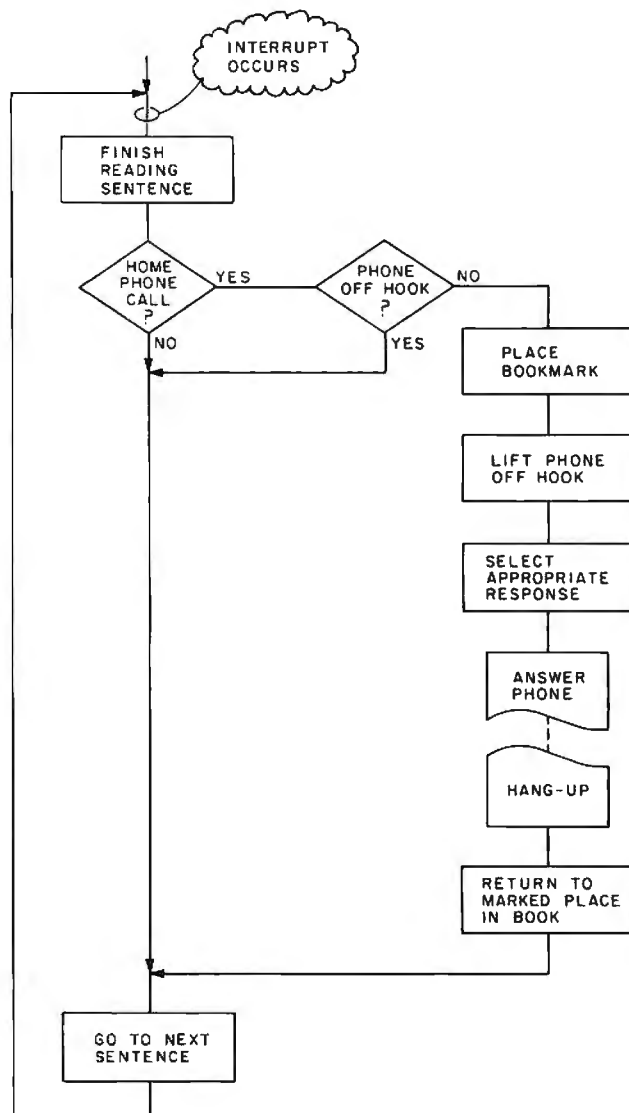

Figure 1: One example of a way to handle a human being's interrupt processing in response to a ringing bell. The ringing bell is like a signal on a multiple source interrupt line of a computer. The first object is to identify the source of the interrupt. If processing is done, the state of the interrupted process (reading a book here) is saved (with a bookmark) while the phone is answered. After the phone call, the reading of the book may be resumed at the place of the bookmark, restoring the original process.

Busy work! It's a terrible thing to inflict on people or computers. Wait loops in input or output operations are busy work for computers, and unless you learn how to tap your computer on the shoulder when you need it, it will probably spend most of its time doing busy work.

As hobbyists, we are always concerned about squeezing the greatest value out of our investments. We want our computers to run as efficiently as possible. Since it is likely that we will be involved in designing and building some of our own IO devices, we should develop an understanding of the concept of interrupts. To efficiently program peripherals for IO purposes it is often necessary to use interrupts.

This article introduces the basic concepts of interrupts, defines the terminology that applies to interrupt mechanisms, and describes the processing events that must occur during the time from the receipt of an interrupt to the return from that interrupt.

Concepts

An excellent example of interrupt processing is the system used in telephones. Let's see why.

We know when someone is trying to call us because the telephone rings. But consider how much time would be wasted if we had to periodically pick up the receiver to see if anyone was on the telephone if the phone had no bell. This periodic method is called *polling*; it works well for telethons and radio talk shows. However, it's not the best method for normal home telephone installations. Assume you receive an average of one or two phone calls a day at home. Imagine yourself as a processor and the callers as the IO requests from a keyboard. The order of magnitude differences in this example are about the same as with your processor and its IO. The bell on your telephone is, of course, an *interrupt*. It is an

ATTENTION SWTPC DISC SYSTEM USERS

All Ed Smith's M6800 SOFTWARE TOOLS

are now available in mini FLEX format as well as Smoke Signal Broadcasting format. See July BYTE for diskette media prices. Disc users specify SSB OR SWTPCO

- M6800 RELOCATING ASSEMBLER AND LINKING LOADER software for rapid program development and debugging. Some of its features are RELOCATABLE CODE-FULL ALPHABETIZED CROSS REFERENCE LISTING-BOTH GLOBAL AND LOCAL LABELS LISTING OF EXECUTION TIME-RELATIVE BRANCH TARGET ADDRESSES-8 CHARACTER LABELS-CORESIDENT EDITOR-ENGLISH ERROR MESSAGES-80 COLUMN LISTING USING PR 40 etc.
- M68AS .cassette \$50.00
 M68AS-D .minifloppy \$55.95
- M6800 RELOCATABLE DISASSEMBLER AND SEGMENTED SOURCE TEXT GENERATOR. This software tool enables you to modify and adapt those large sized object programs and re-assemble them on your system without requiring enormous memory. This program will produce segmented source text files with all the external linkage information required for re-assembly using the above Relocating Assembler.
- M68RS .cassette \$35.00
 M68RS-D .minifloppy \$40.95
- M68ASPK Above two programs on single diskette \$85.00
- The above two programs are furnished in relocatable formatted code with instruction manuals and commented assembly listings. The loader is also supplied in standard MIKBUG format on cassette or as a binary file on disc to initially load the linking loader at any desired address.
- The linking loader is also available in EPROM on two 2708's for \$45.00. Specify desired address and version, i.e. cassette, FLEX or SSB.

8-M-I-T-H-B-U-G

FIRMWARE from Ed Smith's SOFTWARE WORKS

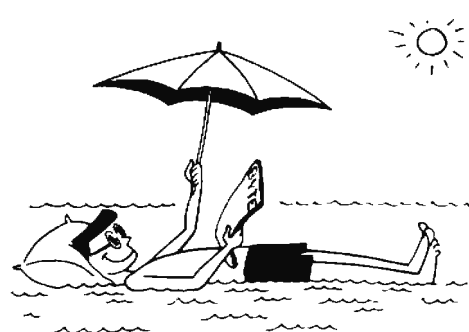

- A 2k Monitor Disassembler-Trace Debugging Tool in EPROM. Use as stand-alone monitor or as an adjunct to your Smithbug or Swtbug. Requires ACIA as control port. Provides all the monitor commands (23) you could ever ask for, plus the convenience of a mnemonic disassembler and single stepping disassembler trace display. Interactive use of single or dual breakpoint with trace pickup at breakpoint, plus many new monitor functions and sub-routines, makes this a super tool you will love to work with. Uses location \$F800 to \$FFFF. Furnished on two 2708's or one 2716. Includes Manual and commented assembly listing. Specify ACIA location and present monitor in order to keep \$A000 RAM compatibility.
- SMITHBUG ON 2708's \$60.00
 SMITHBUG USER SUPPLY \$40.00
- Get under Ed Smith's Software RUG (Relocating assembler Users Group). All RUG members will have use of a building software support library in relocatable format. Upcoming items are a Floating Point package and a Trig package.
- Order direct by check. Specify system configuration if other than SWTPCO. California residents add 6% sales tax.

excellent way to resolve the asynchronism and speed differentials of the telephone communications system. Interrupts can resolve the same fundamental mismatches for computers as well.

Terminology

Let's carry this analogy a little further to introduce the terminology that refers to variations of the basic interrupt concept.

If your phone is ringing, and you are about to process an interrupt, what are your reactions? How does your interrupt processing work?

More than likely, you will perform a sequence of actions precisely analogous to those your microprocessor performs when it receives an interrupt. Figure 1 is a flowchart of the typical procedure we would run through for a telephone interruption. It consists of both the *housekeeping* chores of switching from the background task you were doing, reading, to the interrupt task, answering the phone, and back again in an orderly and complete fashion, as well as the interrupt handler itself.

In the computer an interrupt is a special control signal that is sent to your microprocessor when a given asynchronous event, such as a switch closure, or an IO ready signal, is detected by your system. It is the mechanism by which your processor is forced to take note of that exceptional event.

The interrupt causes your processor to transfer control to a set of instructions known as the *interrupt handler*. The interrupt handler is nothing more than a pre-coded contingency plan in the form of a subroutine that may be called at any time in response to an interrupt signal. What you do in this subroutine is limited only by the software capabilities of your processor.

In microprocessors, interrupt processing is basically a software technique with varying degrees of hardware support depending on your particular processor and system. The term *vectored interrupt* refers to a simple method of reacting to an interrupt. The processor is sent to the interrupt handler which will lead the processor through steps to determine the source of the interrupt, initiate appropriate actions and return to the point of interruption. The *vector* is simply the starting address of the interrupt handler, and is supplied either externally or internally, depending upon your particular processor's hardware.

Microprocessor integrated circuit designers who seek to minimize the hardware requirements in their processors often

assign a fixed location or set of locations in the processor's address space to hold the vector(s). The 6800 processor uses this approach, as does the Texas Instruments TMS-9900. Other processors such as the 8080 receive their vectors directly from external sources, a method which usually involves more system hardware.

The built-in process that occurs in your microprocessor chip is usually limited to saving the program counter and the processor's status register, masking subsequent interrupts, and then *transferring control* to your interrupt handler (loading the program counter with the interrupt handler's starting address). The task of determining where the interrupt came from is left to the interrupt handler itself. In the simplest case, where you have only one device tied to an interrupt line, the origin of the interrupt is implied. Since we may at some time have more devices than we have separate interrupt lines, we should also know how to make a more sophisticated system capable of handling many devices.

To see how multiple interrupts are handled, consider another analogy. Assume you had just settled back into your easy chair after finishing with the telephone interruption, when suddenly a pair of hands covers your eyes and a voice says, "Guess who?" You've been interrupted again, and you don't know which of your 12 children it is, so you will have to save your place again, and begin by saying, "Is that you Olen?" . . . "No." . . . "Is it you Travis?" . . . "No." . . . "Is it you Mary Ellen?" . . . etc, until you get a positive response. In much the same way, several devices can use a single common interrupt line to your processor so that, once the interrupt handler is initiated, it can interrogate all the devices to see which one sent the interrupt signal. To accomplish this, it is customary to have a *device status register* in the microprocessor's address space for each individual device. The data in this location indicates the device's current status: busy or ready.

Now suppose this game of guess-who is very popular with your children, and they are all playing it on you, some much more often than others. Your best strategy would probably be to adopt an ordering scheme to *optimize* the handling of these many interruptions. This simply means that you would guess the names of the children who were the most frequent players first, and check the least likely ones last. Similarly, in interrupt processing you should arrange the order of checking the device status registers of your IO units from the most frequent source of interrupts to the least

The **8100** by **HUH ELECTRONICS**

An S-100 Bus Adapter/Motherboard for the TRS-80 plus a whole lot more!!!

- S-100 BUS INTERFACE
- 6 SLOT MOTHERBOARD
- SERIAL RS232/20ma I/O
- PARALLEL INPUT AND OUTPUT
- SPACE FOR 16K DYNAMIC RAM
- CAN USE LEFT OVER 4K CHIPS
- LOW COST — PRICES START AT \$185*
- AVAILABLE IMMEDIATELY

The 8100 allows a home, Shuck TRS-80 computer to be interfaced to the popular S-100 bus for memory expansion and extended I/O capabilities. For example, you can now easily add more memory, floppy disc systems, PROM boards, printer interfaces, multi-purpose I/O boards, AC device controllers, and a whole host of other varied peripherals.

The 8100 has its own built-in slot in motherboard which we call our unique card guide system which keeps the boards in their place.

The 8100 has support circuitry and sockets for eight 16K dynamic RAM chips allowing you to expand the memory of your TRS-80 by 32K without having to buy any S-100 RAM boards.

If you purchased an expansion memory kit for TRS-80 you could be left with eight 4K RAM chips and nowhere to put them! Well, they can go in the RAM sockets instead! That's right, you can use either 4K or 16K chips and address them anywhere you like.

The 8100 has a full RS232C 20 ma serial interface which stores address, RS232C and 20 ma current loop interface software, programmable baud rate from 10 to 16K baud, software programmable modem control lines on board DB25 connector and much more.

The 8100 also has an 8 bit parallel input port and an 8 bit parallel output port. Both are latched, have both positive and negative strobe inputs and outputs and have picos of drive capability.

Need Intelligence in your 488 Instrumentation System ???

Get it with your favorite S-100 computer and the P&T-488 Interface Board.

The P&T-488 Interface Board gives your S-100 computer the ability to be a talker, listener, or controller on the IEEE-488 instrumentation bus. Three software packages are available: 1) Driver for **North Star DOS/BASIC 2)** Driver for **CP/M** which can be used by **MBASIC** or **CBASIC** 3) Driver for direct assembly level programming (for generating customized systems.) Price of the P&T-488, assembled and tested with any one of the software packages, is \$400.

PICKLES & TROUT
P.O. BOX 1206, GOLETA, CA 93017, (805) 967-9563

frequent. By ordering your interrupt servicing this way, you can add significantly to the efficiency of your system.

By now you've probably realized that the idea of letting multiple devices share one interrupt line is problematical: two devices may want to interrupt the processor at the same time. In terms of our analogy, all 12 of your children may want to play the guess-who game with you at the same time. The way to handle this

situation is to say, "Hold it! I will play the game with each of you. . .but only one at a time." By doing this you act on one interrupt while you *mask out* the rest.

The concept of *maskable interrupts* is incorporated in many of today's processors. There is usually a mask bit or bits used to block or *mask* the interrupt signal from the processor. This masking is frequently part of the built-in process on your microprocessor chip to protect the function of saving critical information, such as the program counter and status register, from subsequent interrupts. Once masked out, your system's design will determine if a subsequent interrupt will be held pending or lost. Interrupts that are kept pending are often referred to as *queued interrupts*. Sometimes circuitry external to the processor chip itself is used to give the pending interrupts an order of priority in much the same way as you might tell your children to line up in the order of youngest to oldest to play the guess-who game. The *N level priority* interrupt capabilities that are mentioned as features of microprocessor systems refer to this type of interrupt queuing. A higher priority interrupt that arrives after several low priority ones will usually bump the lower priority interrupts down in the queue.

For those cases where an interrupt must get the processor's attention right away, a *nonmaskable interrupt* is usually also provided in the chip's structure. This control line is for a very high priority function of your choice, which can override the maskable interrupts even if they are in progress. This is valuable for very high speed IO, such as a floppy disk unit, and for hardware emergencies such as fire or power loss routines. Your system reset is usually a non-maskable interrupt.

Mechanisms

Now that you have a feel for the terminology, let's take a look at the mechanisms and processing that are common to all interrupt routines. Figure 2 is a typical flowchart of the functions necessary to accomplish the transfer of control from the background processing to the interrupt handler and return. You may think of this as putting the background process "on hold" while the interrupt is processed and recommencing the background process when it returns. The background process is not affected by what has happened; thus the interrupt processing is completely transparent to the background process and may be executed at any time without fear of disturbing it. The only definite change is

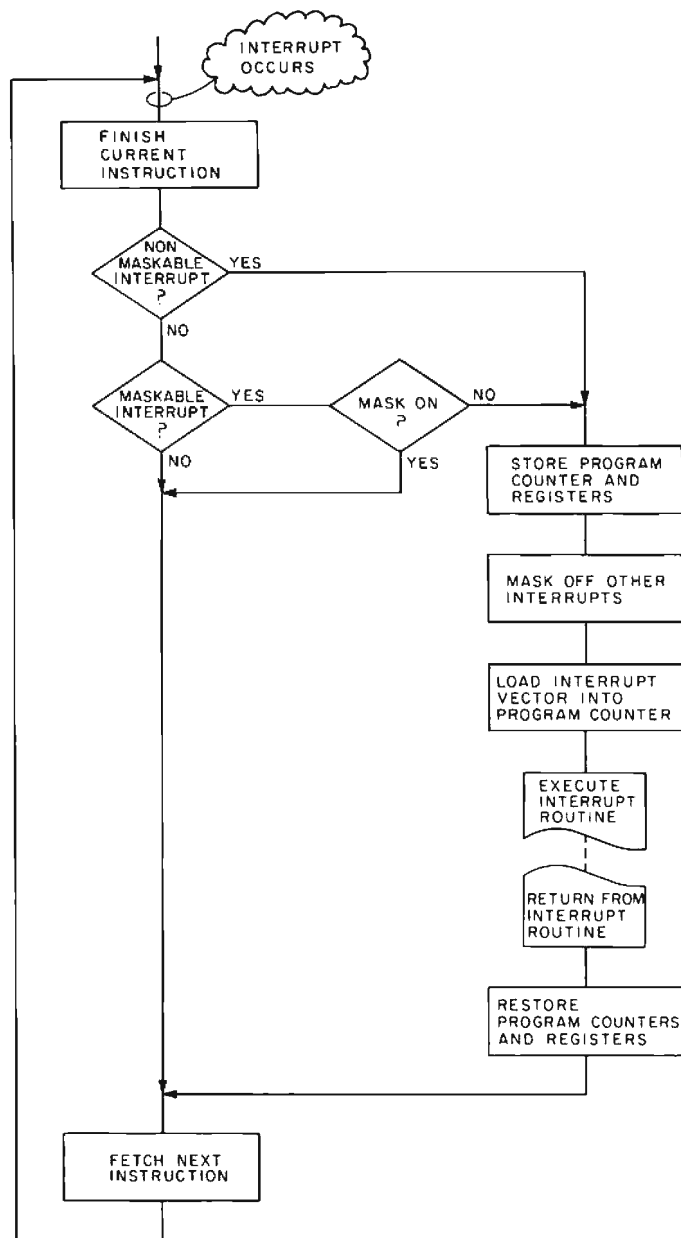

Figure 2: Analogous to the human interrupt processing of figure 1, the typical computer's interrupt processing activities are shown by this chart. The differences between the two figures (1 and 2) are largely in the activities described in each box; the form of the processing logic in this particular set of examples is nearly identical.

is serious about **CAI**

MICROPI introduces **COMMON PILOT**, the only computer-assisted instruction language that makes a micro-based system comparable to the most expensive CAI system in the world! Features include floating point, matrices, scientific functions, string manipulation, pattern matching, dynamic indirect execution of strings, graphics (on certain terminals), and program modules of virtually any length, limited only by disk capacity. Completely compatible implementations are available for a wide variety of computers including 8080/Z80 for North Star DOS or CP/M (\$275), Helios II (\$295), TRS-80 (\$195), SwTPC 6800 (multi-user version from SwTPC), TERA 8510, ODELL-85, Alpha Microsystems and more, including the possibility of implementation on any system with interactive **PASCAL**. Don't confuse **COMMON PILOT** with less powerful versions of **PILOT**.

Also available, a cassette-based subset of **COMMON PILOT** written in Microsoft BASIC for TRS-80, Apple and others (\$85).

MICROPI also offers quality CAI courses written in **COMMON PILOT**. **MICROPI** will pay author royalties for quality CAI materials accepted into our catalog.

If you are serious about CAI, send \$6 for the **COMMON PILOT AUTHOR'S GUIDE** and see what a state-of-the-art CAI system is all about.

DATAFACS

Software now for:
Micropolis and NorthStar

Good Software is Essential for an Efficient Business. Now, the finest in software at a price you can afford. We are definitely the affordables!

PROGRAMS CURRENTLY AVAILABLE:

INVENTORY PROGRAM PACKAGE

- Inventory Addition • Update
- Analysis (Current month) • Analysis (Year to date)
- Search • Vendor File

Also generates 7 additional user reports and much, much more.

— Cost \$175.00 —

MAILING LIST PROGRAM (Single Drive)

*Print formatting in 80 or 132 columns.

— Cost \$20.00 —

The above programs are designed to run under the following:

- *CP/M in CBASIC } Micropolis and NorthStar
2 drives required
- *CP/M in BASIC E } also IMSAI IMDOS
(2) 8" disc IBM 3740 Format required

EXTENSIVE CONTRACTORS ESTIMATING PROGRAM

Literature available upon receipt of your letterhead

Currently Under Development:

- Billing } Available
- Payroll } early in '79
- General ledger } in new CBASIC-2

Table 1: The following list of responsibilities must be jointly met by both the programmer and the system being programmed, if interrupts are to be properly handled. The key item to remember is that when the interrupt occurs, the critical data values which determine the state of the machine must be saved so that at the end of the interrupt process, the original process can be resumed "as if the interrupt never happened."

- Sensing an interrupt signal and determining appropriate response.
- Setting the mask to protect the processor from subsequent interrupts.
- Note where you are by saving the program counter and status register.
- Transferring processor control by loading the program counter with the interrupt vector address.
- Executing the interrupt handler which may:
 - save accumulator(s).
 - save index register(s).
 - save pointers(s).
 - search for interrupt source.
 - satisfy device request.
 - restore pointer(s).
 - restore index register(s).
 - restore accumulator(s).
 - clear the interrupt mask.
- Resume normal processing by restoring the program counter and the processor status register.

that the background processing will slow down somewhat because the processor has to take extra time to service the interrupt(s). As a result, any real time clocking in the system will be offset by that interrupt processing time.

The joint responsibility of the processor and you, the interrupt routine programmer, is to insure that the background process is not disturbed. These responsibilities are simply stated in table 1.

Within the interrupt handler it is not always necessary to save all of the working registers for every interrupt, but you must at least save and restore every register used in your routine.

Deciding when to remove the interrupt

protection (clear the mask) is your responsibility. The key is to pick a point which comes after the saving of the critical registers. The mask shouldn't be removed in the middle of your interrupt routine unless the routine is *reenterable*. Reenterancy is a term that refers to software routines that find new memory locations to store their working data each time that they are reentered before they have been exited. The significance of this is that if you clear the mask and a subsequent interrupt arrives, stops your current interrupt processing, and begins to use the same interrupt routine you were just using, you must ensure that it doesn't destroy your current working data. The safest procedure is to stay masked throughout the interrupt processing until you become experienced with the reentry software techniques. Figure 3 shows the division of these interrupt processing duties for a typical micro-computer system.

If your processor's monitor was supplied by the manufacturer, there is much to be learned from studying its interrupt handler section. Look for the methods used to accomplish the basic steps we have outlined above, then write your own simple interrupt handler, modify the interrupt vector to point to your routine instead of theirs, and execute your interrupt handler.

Once you have done this successfully, you will have developed an appreciation of how the modern digital computer, large or small, services the requests of so many peripheral devices seemingly simultaneously. Understanding interrupt driven processing, which is the central concept of computer operating systems, will help you to grasp the awesome power that lies within your own personal computing system. ■

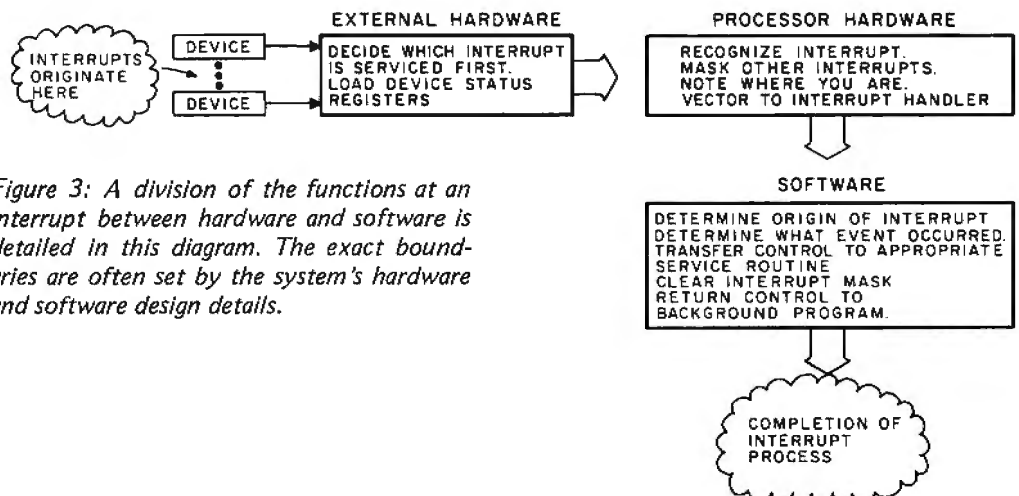

Figure 3: A division of the functions at an interrupt between hardware and software is detailed in this diagram. The exact boundaries are often set by the system's hardware and software design details.

CP/M™ LOW-COST MICROCOMPUTER SOFTWARE

CP/M™ OPERATING SYSTEM:

- Includes Editor, Assembler, Debugger and Utilities.
- For 8080, Z80, or Intel MDS.
- For IBM-compatible floppy discs.
- **\$100**-Diskette and Documentation.
- **\$25**-Documentation (Set of 6 manuals) only.

MAC™ MACRO ASSEMBLER:

- Compatible with new Intel macro standard.
- Complete guide to macro applications.
- **\$90**-Diskette and Manual.

SID™ SYMBOLIC DEBUGGER:

- Symbolic memory reference.
- Built-in assembler/disassembler.
- **\$75**-Diskette and Manual.

TEX™ TEXT FORMATTER:

- Powerful text formatting capabilities.
- Text prepared using CP/M Editor.
- **\$75** Diskette and Manual.

APPLE II USERS WE'VE GOT SOFTWARE!

We have the best disk file management system in the market. Use it for your mailing list, accounts receivable, payables, personnel records, etc.

In addition, we offer not only the most fascinating basic programming course for people with little or no programming experience, but also commercial software for North Star Horizon Computers and Ohio Scientific Computers, and over one hundred programs for Apple II Computers.

The file management system is available for \$60.00 and the programming course for \$30.00.

Please specify tape or disk version.

Check, money orders and credit cards accepted.

Florida residents add 4% tax.

A Message to our Subscribers

From time to time we make the BYTE subscriber list available to other companies who wish to send our subscribers promotional material about their products. We take great care to screen these companies, choosing only those who are reputable, and whose products, services, or information we feel would be of interest to you. Direct mail is an efficient medium for presenting the latest personal computer goods and services to our subscribers.

Many BYTE subscribers appreciate this controlled use of our mailing list, and look forward to finding

information of interest to them in the mail. Used are our subscribers' names and addresses only (no other information we may have is ever given).

While we believe the distribution of this information is of benefit to our subscribers, we firmly respect the wishes of any subscriber who does not want to receive such promotional literature. Should you wish to restrict the use of your name, simply send your request to BYTE Publications Inc, Attn: Circulation Department, 70 Main St, Peterborough NH 03458. Thank you.

OMSI PASCAL™

Reliable, efficient, production Pascal compiler for the DEC PDP-11 family, including the LSI-11.

Full Language

All elements of Standard Pascal, including the capabilities not found in student Pascals. Extensions for complete low-level control with direct memory access, embedded assembler code, FORTRAN procedure interface.

Production

Integrated with DEC operating systems (RSTS/E, RT-11, RSX, IAS). Compatible with existing file structures, editors, and utilities. Interactive symbolic Debugger with breakpoints and full trace.

Performance

Fast one-pass compiler runs in 16K words (32KB), translates thousands of lines per minute. Produces compact PDP-11 code that runs circles around interpretive or threaded languages.

Proof

In production use since 1975 — now at more than 300 customer sites. Warranted for 1 year after purchase.

Write for information, demonstration, manuals, and benchmark.

History of Computers

Keith S Reid-Green
Technical Staff
David Sarnoff Research Ctr
Princeton NJ 08540

The 650 was the most popular IBM computer during the 1950s until it was supplanted by the 1401 at the end of the decade. The machine was used widely by small banking, accounting and insurance companies which did not require the capabilities of the relatively powerful 705, and it is safe to say that IBM's current share of the commercial data processing market got its initial impetus from the successful marketing of the 650. However, the sophisticated personal computer user of today wouldn't give a passing glance to a machine of its capabilities.

The original 650 consisted of three units: the power supply, console and card reader/punch. Later modifications allowed for the addition of an on line printer and magnetic tape units, but the original 650 was strictly cards in and cards out. A tabulating machine such as the 407 was therefore required to produce printout, but this system was not satisfactory from financial and ecological points of view, since punching cards as an intermediate step to a printed page is very wasteful. The really bad news, however, was storage. Either 1000 or 2000 10 digit deci-

mal words could be stored on a magnetic drum in bands of 50 words, each band having its own read head. Since the drum rotated at 12,500 revolutions per minute, average access time (half a revolution) was a little less than one hundredth of a second, or in modern terms 9,600,000 ns.

The problem of rotational delay could have been a serious detriment to processing speed except for a very clever assembly program. Modern computers using random access memory are programmed on the assumption that, in the normal course of execution, instructions are stored in consecutive locations. Had this been the case on the 650 it would have reduced processing speed to roughly one instruction per drum revolution, or 12,500 program steps per minute, because the processor was not fast enough to process an instruction in less time than it took for the next instruction to pass under the drum's read heads. However, instructions consisted of an operation code and two addresses; a data address and a next instruction address. Theoretically, the programmer could organize an optimum way to store the finished program so that the completion of each instruction coincided with the arrival of the next instruction under a read head. Since execution times varied from one instruction type to another, it was very difficult to optimize a program by hand.

Photo 1: The basic IBM 650, consisting of power unit, processor and card reader/punch.

The IBM 650

Fortunately, the SOAP assembler (SHARE optimum assembly program) did a pretty good job of optimizing the object programs it produced.

The instruction execution process was accomplished through a minimal number of registers (see figure 1). An instruction was brought from the drum to the program register, where the operation code and data addresses were passed on to the 2 digit operation register and 4 digit address register. If necessary, the data word specified by the address register was brought to the distributor, where it may have been used in conjunction with the lower or upper accumulators (the accumulators were logically considered as a

20 digit number separated into upper and lower halves). Then the instruction address was moved from the program register to the address register in order to process the following instruction.

Validity checking of numbers took place whenever they were transferred among registers or to the drum. Digits were stored in bi-quinary form, requiring seven binary bits per digit, in which one of two bits represented either 0 or 5 and one of the remaining five bits represented 0, 1, 2, 3 or 4. The sum of the two "on" bits could therefore represent the digits 0 thru 9 and the validity check ensured that exactly one bit of the pair and one of the group of five was "on."

Given the other constraints of the 650, the instruction set was reasonably complete, including read and punch, branching, add, subtract, multiply and divide, shifting and even a table lookup instruction. Routines

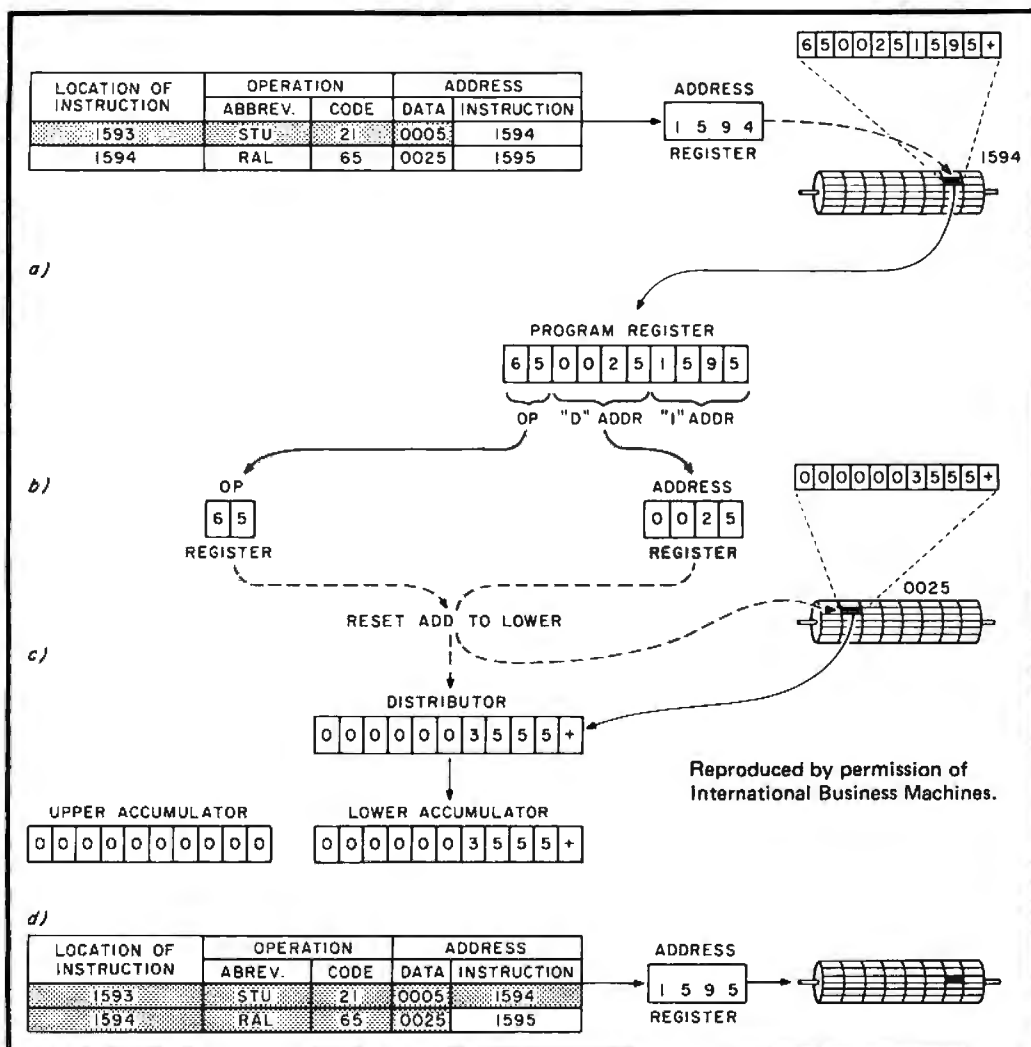

Figure 1: The instruction execution cycle of the IBM 650.

Reproduced by permission of International Business Machines.

Photo 2: The magnetic drum memory showing positioning of the read heads.

to simulate floating point were available through the SHARE user group, but they were slow in operation. In most cases it was preferable to assume decimal point positions and to use shift instructions to align them before adding.

Input and output were restrictive and clumsy due to reliance on punched cards. Even in the later days of the 650 when magnetic tapes were available, flexibility was not greatly increased. Since tape was faster than the drum, a core memory buffer of 120 words was used, and all tape records were of this length.

The biggest problem of all was the small memory. 2000 10 digit words cannot be equated exactly with, say, 8 K bytes. While five alphabetic characters could be stored in one 650 word, each number and each instruction took up a full word. In a personal computer having a 16 bit word, a program of 2000 instructions takes less than 4 K bytes.

It would have completely filled the memory of the 650.

Given all these failings, why was the 650 so popular? Because it was the only mini-computer that IBM made at that time. Although Burroughs built the 205 at about the same time, no company except IBM had established itself as a viable computer manufacturer (in 1959 IBM had about 90% of the computer market). Furthermore, the 650 was seen as a natural replacement for punched card calculators like the 602, which were used in conjunction with the so-called electric accounting machines, sorters, collators and tabulators, to handle payroll and accounting problems. Clearly, at a rate of \$600 per hour, the 704 or 705 could not be used by smaller businesses. The 650 cost about \$50 per hour, which nowadays is a preposterous rate for such low computing power, but in the 1950s was the only answer to the computing needs of small businesses. ■

What's New?

4 MHz Single Card Computer

Cromemco's Single Card computer features the Z-80 processor and S-100 bus architecture. The card offers 4 MHz operation, 8 K bytes of on board 2716 programmable read only memory and 1 K bytes of static programmable memory. It also provides an RS-232 (or 20 mA current loop) serial interface with programmable transmission rates up to 76,800 bps, 24 bits of bidirectional parallel input and output (I/O), five programmable timers and vectored interrupts. Only a power supply and programmable read only memory software are required for operation. The Single Card

computer can also be the core of an expandable S-100 bus system that can include additional memory, I/O, or even floppy disk drives as required.

Cromemco's Z-80 Monitor and 3 K byte Control BASIC are available in 2716 read only memory for use with the Single

Card computer. With these two memories, the computer can be used immediately without any additional memory or I/O. The Monitor has 12 comments to aid in program development. The 3 K byte Control BASIC has 36 commands and functions and can directly access I/O ports and memory locations, and call machine language subroutines.

The Single Card computer is available in kit form for \$395 and assembled and tested for \$450. The Monitor and Control BASIC are available in two read only memories for \$90. For additional information contact Cromemco Inc, 280 Bernardo Av, Mountain View CA 94040. ■

Intelligent Programmer for Intersil Ultraviolet Memory Chips

Pacific Cyber/Metrix Inc has announced availability of its new Model 660 programmer for the 6603 and 6604 4 K bit CMOS ultraviolet erasable read only memory integrated circuits from Intersil Inc.

The Model 660 programmer has been designed specifically for programming the 6603 and 6604 devices. The programmer contains a microprocessor and 4096 bit programmable memory and can be operated stand alone from its front panel or interactively with a video or Teletype terminal through the programmer's built-in RS-232 or 20 mA current loop interfaces. The Model 660 can also communicate with a computer for automated on line programmable read only memory programming.

Built-in features include a full complement of editing capabilities for loading and checking the programmable memory buffer or 660X erasable read only memory, ability to accept all popular paper tape formats, firmware for programmable read only memory copying and verifying, and a front panel erase check capability. Programming time is typically half of that required for similar

N channel device programmers.

The Model 660 is priced at \$645. Contact Pacific Cyber/Metrix Inc, 3120 Crow Canyon Rd, San Ramon CA 94583. ■

Attention Readers and Vendors...

Where Do New Products Items Come From?

The information printed in the new products pages of BYTE is obtained from "new product" or "press release" copy sent by the promoters of new products. If in our judgment the information might be of interest to the personal computing experimenters and homebrewers who read BYTE, we print it in some form. We openly solicit releases and photos from manufacturers and suppliers to this marketplace. The information is printed more or less as a first in first out queue, subject to occasional priority modifications. While we would not knowingly print untrue or inaccurate data, or data from unreliable companies, our capacity to evaluate the products and companies appearing in the "What's New?" feature is necessarily limited. We therefore cannot be responsible for product quality or company performance.

Custom Built Computer Desk

This custom built, all wood desk for your computer system features a split level 55 by 26 inch top with walnut grain Formica. Upper level is 26 by 26 inches (66.04 by 66.04 cm) and is a perfect surface for a printer. The lower level is 30 by 26 inches (76.2 by 66.04 cm) which places the keyboard at elbow height for minimum fatigue. Under the printer area is a 23 by 23 by 24 inch (58.42 by 58.42 by 60.96 cm) compartment with two fully adjustable shelves. There is room for a processor and disk memory. The door opening is 21 by 23 inches (53.34 by 58.42 cm). The standard finish is walnut. Options available are righthand or lefthand design, other finishes and top and minor variations in dimension sizes. Desks are built to customers' requirements and a 50 percent deposit should accompany the order. The price is \$295 from Stephen Moe Company, POB 595, Springfield OR 97477. ■

New Book Explores Varied Facets of Personal Computing

BASIC and the Personal Computer by Dwyer and Critchfield describes the uses of personal computers, then explains how to make these ideas become a reality by using the power of interactive computer programming. It features examples that cover a wide range of applications possible with personal computers.

Topics include microcomputer hardware, programming in BASIC and extended BASIC, computer graphics, word processing, data structures, sorting algorithms, computer games, computer art, simulations, business applications, color graphics and the use of special interface devices.

The book requires no previous experience with computing. The text is integrated with a large number of original illustrations that clarify both beginning and advanced concepts.

This 438 page softbound book is published by Addison-Wesley Publishing Co Inc, Reading MA 01867 for \$12.95. ■

Circle 630 on inquiry card.

Software Package for the North Star Disk System

The Program Utility Package (PUP) includes assembler and BASIC programs to enhance the usability of the North Star BASIC language. These programs use the input and output routines provided by the North Star disk operating system and the user. The package includes: CREF which is an assembler program producing a sorted cross reference of variable and function usage by line number; SMAP is an assembler program which produces a sorted map of line reference by GOSUB and GOTO; FLIST is an assembler program to produce a formatted BASIC program listing; MEMTEST is an assembler

program which performs multiple memory diagnostics on user specified memory ranges; HEXMON is a BASIC program to load or list memory in hexadecimal. Each displayed line of 16 bytes of hexadecimal data also has the ASCII equivalents printed.

This package consists of six programs on a library diskette, 16 pages of documentation, and a diskette folder. The price of PUP is \$25, with program listing available for an additional \$7. For further information, contact Business Computer Systems, 216 Collier Dr, Springfield IL 62704. ■

Circle 631 on inquiry card.

The Complete Star Ship: A Simulation Project

Star Ship Simulation by Roger Garrett explains the methods used in approaching the design of a software simulation. Readers become familiar with the techniques by which any large programming task can be implemented and learn how to attack a program in a straightforward, structured manner.

The first half of the book gives the reader a working knowledge of system design and program structure, and the last half deals with the actual development, and implementation of the Star Ship simulation project. Details are given for every major function aboard a star ship as well as the intelligence of enemy and friendly space craft.

The 122 page book is priced at \$6.95 and is available from Dilithium Press, 30 NW 23rd Pl, Portland OR 97210. ■

Circle 632 on inquiry card.

Assembly Language Development System for 8080 or Z-80

PDS is an assembly language development system for 8080 or Z-80 microcomputers with at least one disk drive. PDS includes a unified assembler and editor, a macro-assembler combining the features of a relocating linking loader, a string-oriented text editor, and a trace debugger and disassembler.

The assemblers favor the Intel instruction mnemonics, treating the Z-80 superset as a logical and syntactical extension. The debug module features breakpoint or single step execution of programs with trace display of all register contents, flag status, a memory window, and the mnemonics of the instruction just executed and the next instruction to be executed.

Source modules are available for floating point arithmetic, floating point IO, trigonometric functions, numerical and alphabetic sorting, matrix inversion, fast Fourier transform and a full function expression evaluator.

The price is \$99. For further information, contact Allen Ashley, 395 Sierra Madre Villa, Pasadena CA 91107. ■

Circle 633 on inquiry card.

Micropolis CP/M System Upgrade

The Micropolis CP/M System Upgrade gives the Micropolis disk owner the full capacities of the CP/M disk operating system while retaining full access to Micropolis' operating system.

The CP/M System Upgrade allows the Micropolis disk owner to directly load and start CP/M and automatically execute a program at system start-up. Other features include dynamic disk space allocation and reclamation, random access on all files, high speed disk read and write and full compatibility with all other CP/M systems and software.

For further details, contact the Computer Mart of New Jersey, 501 Rt 27, Iselin NJ 08830. ■

Circle 634 on inquiry card.

Word Processor for the Commodore PET

Connecticut microComputer has announced a word processor program for the Commodore PET. This program permits composing and printing of letters, flyers, advertisements, manuscripts, articles, etc, using the PET and an RS-232 printer.

Script directives include line length, left margin, centering and skip. Edit commands allow the user to insert lines, delete lines, move lines, change strings, save onto cassette, load from cassette, move up, move down, print and type.

The word processor program addresses an RS-232 printer through a Connecticut microComputer printer adapter. The program can be purchased for \$29.50 from Connecticut microComputer, 150 Pocono Rd, Brookfield CT 06804. ■

IA Expands S-100 Line

Video Display Board

Featuring a full 128 upper/lower case ASCII character set stored in a 1K buffer memory. Easy to read 16 line x 64 character format can be displayed on an inexpensive video monitor or a modified TV set. Includes a TTY software driver. Add our powerful K 2 FDOS to create a versatile operator console.

\$25.00

Disk Controller Board

Controls up to 4 single or double sided drives. Data protect features include automatic disable of write-gate during power-down for data integrity. Supported by a reliable software package, K 2 FDOS and complete diagnostic documentation.

\$35.00

K2 Operating System

Power full disk software in the DEC tradition. Includes Text Editor (TED), File Package (PIP), Debugger (HDT), Assembler (ASMBLE), HEXBIN, 1 COPY, System Generator (SYSGEN). Command syntax follows Digitals OS-8, RT/11 format. First in a family of high level software. Soon to be released, FORTRAN & Pascal Compilers.

\$75.00

Field-proven reliable engineering

Over 10,000 boards worldwide prove Ithaca Audio provides the quality and reliability you demand.

Ithaca Audio Boards are fully S-100 compatible, featuring gold edge connectors and plated-through holes. All boards (except the Protoboard) have fully buffered data and address lines, DIP switch addressing, solder mask and parts legend.

Z-80 CPU Board Most powerful 8 bit central processor available. Featuring power-on-jump, provision for on-board 2708. Accepts most 8080 software. **\$35.00**

8K Static RAM Board High speed static memory at the lowest cost per bit. Includes memory protect/unprotect and selectable wait states. **\$25.00**

2708/2716 EPROM Board Indispensable for storing dedicated programs and often used software. Accepts up to 16K of 2708's or 32K of 2716's. **\$25.00**

Protoboard Universal wire-wrap board for developing custom circuitry. Accepts any size DIP socket. **\$25.00**

RAM! 32K for \$359.

Ithaca Audio is now stocking the Mostek 4115 add-on RAM for S.D.'s Expandoram. Buy their basic board, 32K of RAM from us and SAVE.

Jameco Kits

Digital Stopwatch Kit

Use Interil 7205 Chip
Plated thru double sided P.C. Board
LED display (100)
Times to 99 min 59.59 sec with 1/100 sec resolution
Quartz crystal controlled
Three stopwatches in one single event split (cumulative) and lather (segment timing)
Uses 3 penlite batteries
Size 4.5" x 1.5" x 90

JE900 \$39.95

6-Digit Clock Kit

Bright 300 mcd common cathode display
Uses MM5324 clock chip
Switches for hours, minutes and hold functions
Hours easily viewable to 20 feet
Simulates real time
115 VAC operation
Includes all components, case and wall transformer
Size 6.3" x 3.1" x 1.3"

JE701 \$19.95

ALSO AVAILABLE:
JE200 5v lamp power supply \$14.95
JE2206B Function Generator \$19.95

SILICON

Speech Synthesis Integrated Circuit from TI

A significant new speech synthesis monolithic integrated circuit has been developed by Texas Instruments Inc, POB 5012, Dallas TX 75222. The circuit, along with two 128 K byte dynamic read only memories, each with

the capacity to store over 100 seconds of speech, and a special version of the TMS1000 microcomputer, serve as the main electronics for a new talking learning aid called Speak and Spell, for ages seven and up.

Speech encoding is achieved through pitch-excited linear predictive coding (LPC). LPC is a technique of analyzing and synthesizing human speech by determining from original speech a description of a time varying digital filter modeling the vocal tract. This filter is then excited by other periodic or random inputs. An 8 bit digital to analog converter on the chip transforms digital information processed through the filter into synthetic speech.

Codes for 12 synthesis parameters (ten filter coefficients, pitch, and energy) serve as inputs to the synthesizer chip. These codes are stored in read only memory and, once decoded by on chip circuitry, represent the time varying description of the LPC synthesis model. The LPC speech synthesizer is an advanced design 10 stage lattice filter which has an integrated array multiplier, an adder coupler to the multiplier output and various delay circuits coupled to the adder output. ■

Circle 568 on inquiry card.

Dual Tone Separation Filter Integrated Circuit

The Model AF-100 dual tone separation filter integrated circuit provides channel isolation between the low frequency group tone (DTMF) frequencies 697 Hz thru 941 Hz and the high frequency group tone frequencies 1209 Hz thru 1633 Hz. It is intended for applications in which dual tone separation is required, eg: touch tone decoders, transceivers, modem interfaces, etc. ■

Contained in a 16 pin dual-in-line package, the dual resistance capacitance active filter chip features 30 dB minimum separation between high and low group tones, 1.5 dB maximum in-band deviation, dual and single power supply operation ± 12 VDC at 2.5 mA each.

The Model AF-100 is priced at \$32. For further information write to Data Signal Corp, 40-44 Hunt St, Watertown MA 02172. ■

A VIDEO BOARD + A MEMORY BOARD + AN I/O BOARD - ALL IN ONE!

- STATE OF THE ART TECHNOLOGY USING DEDICATED MICROPROCESSOR I.C.
- NUMBER OF I.C.s REDUCED BY 50% FOR HIGHER RELIABILITY ■ MASTER PIECE OF ENGINEERING ■ FULLY SOFTWARE CONTROLLED

\$199.95

Priced at ONLY Basic Software Included

SPECIAL FEATURES:

- S-100 bus compatible
- Parallel keyboard port
- On board 4K screen memory (optional)* relocatable to main computer memory
- Text editing capabilities (software optional)
- Scrolling: up and down through video memory
- Blinking characters
- Reversed video
- Provision for on board ROM
- CRT and video controls fully programmable (European TV)

- Programmable no. of scan lines
 - Underline blinking cursor
 - Cursor controls: up, down, left, right, home, carriage return
 - Composite video
- *Min. 2K required for operation of this board.

DISPLAY FEATURES:

- 128 displayable ASCII characters (upper and lower case alpha-numeric, controls)
- 64 or 32 characters per line (jumper selectable)
- 32 or 16 lines (jumper selectable)
- Screen capacity 2048 or 512
- Character generation: 7 x 11 dot matrix

OPTIONS:

- Sockets \$10.00
- 2K Static Memory (with Sockets) \$45.00
- 4K Static Memory (with Sockets) \$90.00
- Complete unit, assembled and tested with 4K Memory \$335.00
- Basic software on ROM . . . \$20.00
- Text editor on ROM \$75.00

DEALER

INQUIRIES WELCOMED

TI PROGRAMMER \$53.95

Hexadecimal. Octal. Decimal. Enter a number in base 8, 10, or 16. TI Programmer can quickly convert to either of the other bases. Rapidly handle arithmetic in all three bases giving you more time for important programming or troubleshooting tasks. Ideal for use with any size computer. TI Programmer uses integer "two's complement" arithmetic in hexadecimal and octal bases.

\$44.95
DATA CHROM

Large, easy-to-read 8-digit liquid crystal display. Clock mode displays time, day, date, and AM/PM. Stopwatch mode displays hours, minutes, seconds and tenths of seconds up to 9-59-59.9. Economical—you'll get typically 12 months normal operation on a single set of batteries. Attractive—comes in brown vinyl wallet folder with insert pockets for business cards. Makes a neat addition to your personal or business accessories. 24-hour alarm. Stopwatch records and displays lap and total elapsed times. Up to one-tenth of a second accuracy.

Fully Assembled Video Display Interface for Ohio Scientific Systems

Ohio Scientific is offering the video display interface from its Challenger IIP as a fully assembled accessory for any OSI system. The 540 video display features a 32 row by 64 column display of the standard 64 character ASCII font in 5 by 7 dot matrix form. Standard features include programmable formatting of the display for 32 by 32 or 32 by 64. The 32 by 32 mode is useful for video animation since it provides square character cells. The video board also features a keyboard port which can be used with a standard ASCII keyboard of OSI's new programmable keyboard. The 540 optionally supports a graphics character generator which features lower case and about 170 special characters for plotting and gaming.

All systems using the 540 incorporate OSI's new 542 programmed keyboard. This fully programmable keyboard system is capable of upper and lower case and auto repeat on all characters. The keyboard also features up to five levels of shifting to allow many special single keystroke commands and direct single keystroke graphics. The keyboard has provisions for character editing and supports special formats for video games.

The Model 540 video board is available as an add-on option for any OSI system as a CA-11 for \$249. The graphics character generator option retails for \$29. Contact Ohio Scientific, 1333 S Chillicothe Rd, Aurora OH 44202. ■

Tape Punch Handles Paper and Mylar Tapes

This low cost tape punch, which handles paper or Mylar tape, has been introduced by GNT Automatic Inc, 440 Totten Pond Rd, Waltham MA 02154. The GNT 36 tape punch is designed to handle oiled and dry paper tape and all types of Mylar and Mylar foil tapes without adjustment. Easily integrated into a wide variety of equipment, the unit measures 2.4 by 4.7 by 3 inches (6.10 by 11.94 by 7.62 cm).

Providing a die block life of 150 mil-

lion characters, the GNT 36 punches up to 50 characters per second. With an allowable back tension of about 5 ounces, the bidirectional unit accommodates 5, 6, or 8 hole tape widths, selectable by the user. A second version of the GNT 36 punches up to 75 characters per second.

The GNT 36 tape punch is priced at \$495. Contact GNT Automatic Inc, 440 Totten Pond Rd, Waltham MA 02154. ■

Interface This Electronic Voice System to Your Computer

The Votrax VS-6.4 is an improved model of the VS-6 which produces electronically synthesized human speech from digital data. In the VS-6.4 two circuit boards have been changed to obtain improved voice quality. For those who wish to convert their VS-6 equipment, retrofit boards are available. Software is unaffected by the change.

The Votrax VS-6.4 electronic voice system is flexible and operationally simple. A complete range of interface types and options make it compatible with most conventional computer and communications equipment, and it can be used over telephone lines or paging systems.

For further information contact Votrax, 500 Stephenson Hwy, Troy MI 48084. ■

FULLY
STATIC, AT
DYNAMIC PRICES

WHY THE 2114 RAM CHIP?

We feel the 2114 will be the next industry standard RAM chip (like the 2102 was). This means price, availability, and quality will all be good! Next, the 2114 is FULLY STATIC! We feel this is the ONLY way to go on the S-100 Bus! We've all heard the HORROR stories about some Dynamic Ram Boards having trouble with DMA and FLOPPY DISC DRIVES Who needs these kinds of problems? And finally, even among other 4K Static RAM's the 2114 stands out! Not all 4K static Rams are created equal! Some of the other 4K's have clocked chip enable lines and various timing windows just as critical as Dynamic RAM's. Some of our competitor's 16K boards use these "tricky" devices. But not us! The 2114 is the ONLY logical choice for a trouble-free, straightforward design.

KIT FEATURES:

1. Addressable as four separate 4K Blocks
2. ON BOARD BANK SELECT circuitry (Cromemco Standard!). Allows up to 512K on line!
3. Uses 2114 (450NS) 4K Static Rams
4. ON BOARD SELECTABLE WAIT STATES
5. Double sided PC Board, with solder mask and silk screened layout. Gold plated contact fingers
6. All address and data lines fully buffered
7. Kit includes ALL parts and sockets
8. PHANTOM is jumpered to PIN 67
9. LOW POWER under 2 amps TYPICAL from the +8 Volt Bus
10. Blank PC Board can be populated as any multiple of 4K.

NATIONAL SEMICONDUCTOR JUMBO CLOCK MODULE

\$6.95

2 FOR \$13

(AC XFMR \$1.95)

ASSEMBLED! NOT A KIT!
ZULU VERSION
We have a limited number of the 24 HR Real time version of this module in stock
#MA1008D — \$9.95

PERFECT FOR USE
WITH A TIMEBASE

FEATURES:
• FOUR JUMBO 3/4 INCH LED DISPLAYS
• 12 HR REAL TIME FORMAT
• 24 HR ALARM SIGNAL OUTPUT
• 50 OR 60 HZ OPERATION
• LED BRIGHTNESS CONTROL
• POWER FAILURE INDICATOR
• SLEEP & SNOOZE TIMERS
• DIRECT LED DRIVE (LOW RFI)
• COMES WITH FULL DATA

TERMS: Add 30% postage, we pay balance. Orders under \$15 add 75¢ handling. No C.O.D. We accept Visa, MasterCard, and American Express cards. Tax Res add 5% Tax. Foreign orders (except Canada add 20% P & H 90 Day Money Back Guarantee on all items.

HEX ENCODED KEYBOARD

E.S.
This HEX keyboard has 19 keys, 16 encoded with 3 user definable. The encoded TTL outputs, B-4-2-1 and STROBE are debounced and available in true and complement form. Four onboard LEDs indicate the HEX code generated for each key depression. The board requires a single +5 volt supply. Board only \$15.00 Part No. HEX-3, with parts \$49.95 Part No. HEX-3A. 44 pin edge connector \$4.00 Part No. 44P.

TRS-80 SERIAL I/O

● RS-232 compatible ● Can be used with or without the expansion bus ● On board switch selectable baud rates of 110, 150, 300, 600, 1200, 2400, parity or no parity odd or even, 5 to 8 data bits, and 1 or 2 stop bits. D.T.R. line. Board only \$19.95 Part No. 8010, with parts \$59.95 Part No. 8010A, assembled \$79.95 Part No. 8010C. No connectors provided, see below.

EIA/RS-232 connector Part No. D825P \$6.00, with 9' 8 conductor cable \$10.95 Part No. D825PS.

3' ribbon cable with attached connectors for TRS-80 and our serial board \$19.95 Part No. 3CAB40.

4K EPROM WMC Inc.

This board is designed to operate with any speed or power 1702A. Addressable in 4K byte increments and can be configured to occupy either 2K or 4K segments. It can be populated one memory chip at a time. Bare board \$30, board with parts \$200, assembled \$230. Part No. EPM-1

16K OR 32K EPROM WMC Inc.

Designed to operate with any speed or power 2708 or single voltage (+5V) 2716. Addressable in 4K increments and can occupy multiples of 4K. It can be populated one memory chip at a time. Has bank addressing and Phantom Disable. The board comes with an exclusive software program that can be placed in a 2708 or 2716 that will, when used in conjunction with a RAM memory board, check out every line on the EPM-2. Bare board \$30, board with parts with 2708 \$455, assembled \$485. Board with parts with 2716 \$1,225, assembled \$1,255. Part No. EPM-2

8080A CPU (With Eight Level Vector Interrupt Capability) WMC Inc.

Uses the 8080A and the 8224 clock chip. The crystal frequency used is 18 MHz and the vector interrupt chip is the 8214. The board will function normally without the interrupt circuitry. When the interrupt circuitry is built up, the board will respond to eight levels of interrupts. Designed to be a plug-in replacement for the IMSAI CPU board and will work in other computers with the appropriate modifications made to the ribbon cable connector pin out from the front panel. The board will work in systems without a front panel if the system has a PROM board that simulates the functions of the front panel. Bare board \$30, with parts \$185, assembled \$220. Part No. CPU-1

16K STATIC RAM WMC Inc.

Operates with any speed or power 2114. All input and output lines are fully buffered. Addressable in 4K byte increments. If the system has a front panel, the board will allow itself to be protected. If there is no front panel, the board will not allow itself to be protected. The board has Bank Address capability, Phantom Disable, MWRITE, and selectable wait states. Bare board \$30, board with parts \$665. Part No. MEM2

S-100 BUS ACTIVE TERMINATOR *

Board only \$14.95 Part No. 900, with parts \$24.95 Part No. 900A

9 AND 13 SLOT MOTHER BOARDS WMC Inc.

All traces are reflow solder covered and both sides are solder masked. The connectors used on these boards are the IMSAI™ type (.125" between pins, .250" between rows). Spacing between connectors is .750". All lines, except power and ground, have a passive RC network termination available. There is a kluge area available that will accept two 40 pin sockets and one 36 pin socket. The circuitry for supplying three separate regulated voltages to the kluge area is contained on the board. Part No. GMB-12 \$40 bare, \$105 kit, \$120 assembled. Part No. GMB-9 \$35 bare, \$90 kit, \$105 assembled.

PIICEON 65K DYNAMIC RAM

Main memory for microcomputers, intelligent terminals, business systems, medical systems, and OEM systems. ● High density random access memory 48K bytes or 64K bytes ● Fully buffered ● S-100 bus compatible ● Low power (dynamic memory) ● Transparent refresh ● Digital delay line techniques for reliable operation ● Multiple boards allowed using hardware or software controlled bank select ● "Phantom" signal for RAM/ROM overlap ● All boards are fully tested prior to shipment. Operating System test and extensive bit pattern testing. ● Works directly in 8080A processors or Z-80 environment at 2MHz ● Currently used by industry ● 1 year warranty. Only available assembled and tested with 48K \$1,250 Part No. 48K, or with 65K \$1,475 Part No. 65K

8K EPROM PIICEON

Saves programs on PROM permanently (until erased via UV light) up to 8K bytes. Programs may be directly run from the program saver such as fixed routines or assemblers. ● S-100 bus compatible ● Room for 8K bytes of EPROM non-volatile memory (2708's). ● On-board PROM programming ● Address relocation of each 4K or memory to any 4K boundary within 64K ● Power on jump and reset jump option for "turnkey" systems and computers without a front panel ● Program saver software available ● Solder mask both sides ● Full silkscreen for easy assembly. Program saver software in 1 2708 EPROM \$25. Bare board \$35 including custom coil, board with parts but no EPROMS \$139, with 4 EPROMS \$179, with 8 EPROMS \$219.

To Order: Mention part number, description, and price. In USA, shipping paid for orders accompanied by check, money order, or Master Charge, BankAmericard, or VISA number, expiration date and signature. Shipping charges added to C.O.D. orders. California residents add 6.5% for tax. Outside USA add 10% for air mail postage and handling, no C.O.D.'s. Checks and money orders must be payable in US dollars. Parts kits include sockets for all ICs, components, and circuit board. Documentation is included with all products. Prices are in US dollars. No open accounts. To eliminate tariff in Canada boxes are marked "Computer Parts." Dealer inquiries invited. 24 Hour Order Line: (408) 226-4054

For free catalog including parts lists and schematics, send a self-addressed stamped envelope.

The DATA-TRANS 1000

A completely refurbished
IBM Selectric Terminal
with built-in ASCII Interface.

\$1495.00. For a limited time
save **\$100.00** on each unit ordered.

Now, until April 30, 1979

Only \$1395.00

Features:

- 300 Baud
- 14.9 characters per second printout
- Reliable heavy duty Selectric mechanism
- RS-232C Interface (requires RS-232C port for I/O transmission)
- Documentation included
- 60 day warranty - parts and labor
- High quality Selectric printing
- Off-line use as typewriter

HOW TO ORDER DATA-TRANS 1000

1. We accept Visa, Master Charge. Make cashiers checks or personal check payable to:

DATA-TRANS

2. All orders are shipped F.O.B. San Jose, CA
3. Deliveries are immediate

For orders and information

Phone: (408) 263-9246

MODEM*

• Type 103 • Full or half duplex • Works up to 300 baud • Originate or Answer • No coils, only low cost components • TTL input and output-serial • Connect 8 Ω speaker and crystal mic, directly to board • Uses XR FSK demodulator • Requires +5 volts • Board only \$7.60 Part No. 109, with parts \$27.50 Part No. 109A

APPLE II* SERIAL I/O INTERFACE

Baud rate is continuously adjustable from 0 to 30,000 • Plugs into any peripheral connector • Low current drain. RS-232 input and output • On board switch selectable 5 to 8 data bits, 1 or 2 stop bits, and parity or no parity either odd or even • Jumper selectable address • SOFTWARE • Input and Output routine from monitor or BASIC to teletype or other serial printer • Program for using an Apple II for a video or an intelligent terminal. Also can output in correspondence code to interface with some selectrics. • Board only \$15.00 Part No. 2, with parts \$42.00 Part No. 2A, assembled \$62.00 Part No. 2C

UART & BAUD RATE GENERATOR*

• Converts serial to parallel and parallel to serial • Low cost on board baud rate generator • Baud rates: 110, 150, 300, 600, 1200, and 2400 • Low power drain +5 volts and -12 volts required • TTL compatible • All characters contain a start bit, 5 to 8 data bits, 1 or 2 stop bits, and either odd or even parity. • All connections go to a 44 pin gold plated edge connector • Board only \$12.00 Part No. 101, with parts \$35.00 Part No. 101A, 44 pin edge connector \$4.00 Part No. 44P

T.V. TYPEWRITER

• Stand alone TVT • 32 char./line, 16 lines, modifications for 64 char./line included • Parallel ASCII (TTL) input • Video output • 1K on board memory • Output for computer controlled cursor • Auto scroll • Non-destructive cursor • Cursor inputs: up, down, left, right, home, EOL, EOS • Scroll up, down • Requires +5 volts at 1.5 amps, and -12 volts at 30 mA • All 7400, TTL chips • Char. gen. 2513 • Upper case only • Board only \$39.00 Part No. 106, with parts \$145.00 Part No. 106A

T.V. INTERFACE

• Converts video to AM modulated RF, Channels 2 or 3. So powerful almost no tuning is required. On board regulated power supply makes this extremely stable. Rated very highly in Doctor Dobbs' Journal. Recommended by Apple • Power required is 12 volts AC C.T., or +5 volts DC • Board only \$7.60 part No. 107, with parts \$13.50 Part No. 107A

(Illegal where prohibited by law.)

TAPE* INTERFACE

• Play and record Kansas City Standard tapes • Converts a low cost tape recorder to a digital recorder • Works up to 1200 baud • Digital in and out are TTL-serial • Output of board connects to mic. in of recorder • Earphone of recorder connects to input on board • No coils • Requires +5 volts, low power drain • Board only \$7.60 Part No. 109, with parts \$27.50 Part No. 109A

QUEST Cosmac Super Elf Computer \$106.95

Compare features before you decide to buy any other computer. There is no other computer on the market today that has all the desirable benefits of the Super Elf for so little money. The Super Elf is a small single board computer that does many big things. It is an excellent computer for training and for learning programming with its machine language and yet it is easily expanded with additional memory, Tiny Basic, ASCII Keyboards, video character generation, etc. The Super Elf includes a ROM monitor for program loading, editing and execution with SINGLE STEP for program debugging which is not included in others at the same price. With SINGLE STEP you can see the microprocessor chip operating with the unique Cost address and data bus displays before, during and after executing instructions. Also, CPU mode and instruction cycle are shown on several LED indicator lamps.

An RCA 1861 video graphics chip allows you to connect to your own TV with an inexpensive video modulator to do graphics and games. There is a speaker system included for writing your own music or using many music programs already written. The speaker amplifier may also be used to drive relays for control purposes.

A 24 key HEX keyboard includes 16 HEX keys plus load, reset, run, input, memory protect,

memory select, monitor select and single step. Large, on board displays provide output and optional high and low address. There is a 44 pin standard connector for PC cards and a 50 pin connector for the Quest Super Expansion Board. Power supply and sockets for all IC's are included in the price plus a detailed 90 page instruction manual.

Many schools and universities are using the Super Elf as a course of study. OEM's use it for training and research and development.

Remember, other computers only offer Super Elf features at additional cost or not at all. Compare before you buy. Super Elf Kit \$106.95, High address option \$8.95, Low address option \$9.95. Custom Hardwood Cabinet with drilled and labeled front panel \$24.95. NiCad Battery Backup Kit \$4.95. All kits and options also come completely assembled and tested.

Questdata, a 12 page monthly software publication for 1802 computer users is available by subscription for \$12.00 per year. New 100 page software manual Vol.1 \$4.

Free 32 Page Short Form Guide from Analog Devices

This new *Short Form Guide* contains a complete listing of Analog Devices' line of more than 400 products for precision measurement and control, including digital to analog, analog to digital, voltage to frequency and frequency to voltage converters; sample and hold amplifiers; multiplexers, switches and references; operational amplifiers, instrumentation amplifiers and isolation amplifiers; com-

putational circuits; root mean square to DC converters; analog input and output subsystems for microcomputers; data acquisition subsystems; temperature transducers; digital panel instruments; and power supplies. Products are listed with basic specifications and prices. Contact Analog Devices, Rt 1 Industrial Park, POB 280, Norwood MA 02062. ■

For Newcomers to the Computer Field

BASIC From the Ground Up by David E. Simon assumes the reader knows nothing about computers. All the statements of BASIC are detailed as well as what goes on inside the computer when programming. The book covers at least one version of each of the BASIC statements along with some of their variations. *BASIC From the Ground Up* is 232 pages long and is priced at \$8.95. Contact Hayden Book Company Inc, 50 Essex St, Rochelle Park NJ 07662. ■

Circle 563 on inquiry card

Small Computer Systems Handbook by Sol Libes

Small Computer Systems Handbook by Sol Libes is written for those new to the field of personal computers. The emphasis throughout is on important practical knowledge that the small computer user should have to be able to intelligently purchase, assemble and interconnect components, and to program the microcomputer.

This guide provides background in digital logic fundamentals, number systems, and computer hardware and software basics. Only a minimal amount of electronics is required. The book offers an introduction to programming on the machine level, and with higher level languages such as BASIC.

The various applications of small computers are described, such as maintaining financial records, storing records, controlling appliances, typewriting, sales analysis and inventory control.

This 197 page book is priced at \$8.45 and is published by Hayden Book Company Inc, Rochelle Park NJ 07662. ■

Free Information on Commodore PET

Are you having difficulty locating information on the Commodore PET computer? New England Electronics Company, 248 Bridge St, Springfield MA 01103, has available free of charge a PET information package as well as a software and hardware products directory. The information package includes specifications on the PET 2020 printer, PET service and warranty information and other pertinent data concerning the PET. ■

Catalog Features Personal Computing

Introduction to Personal Computing is a composite of companies providing personal computing hardware and software to the marketplace. Included are profiles of 69 companies and an overview of their product offerings. It also includes the names and addresses of various computer related publications. This 72 page catalog is available for \$25 (\$5 handling charge if payment does not accompany the order). New Jersey residents should include 5% sales tax. For further information contact Alltech Publishing Company, 212 Cooper Center, N Park Dr and Browning Rd, Pennsauken NJ 08109. ■

PET Magazine on Cassette

Program is a new monthly magazine recorded on cassette and intended for use by 8K byte Commodore PET computer owners. Subscribers will receive a standard magazine format for video display on side 1 of the cassette, with pages of articles, applications, sources of hardware and software, avail-

ability of peripherals, programming hints, etc. The reverse side contains three or more games, household and business programs, etc. The subscription rate is \$27 per year. For further information contact *Program*, POB 461, Philipsburg PA 16866. ■

HOBBY WRAP TOOL

Wire-wrapping, stripping, unwrapping tool for AWG 30 on .025 (0.63mm) Square Post.

Regular Wrap	WSU-30	\$6.95
Modified Wrap	WSU-30M	\$7.95

P.C. BOARD

The 4 x 4.5 x 1/16 inch board is made of glass coated EPOXY Laminate and features solder coated 1 oz copper pads. The board has provision for a 22/84 two sided edge connector, with contacts on standard 156 spacing. Edge contacts are non-dedicated for maximum flexibility. The board contains a matrix of 640 in diameter holes on 100 inch centers. The component side contains 76 two-hole pads that accommodate any DIP size from 6-40 pins, as well as discrete components. Typical density is 18 of 14-Pin or 18 Pin DIPs. Components may be soldered directly to the board or intermediate sockets may be used for soldering or wire wrapping. Two independent bus systems are provided for voltage and ground on both sides of the board. In addition, the component side contains 14 individual buses running the full length of the board for complete wiring flexibility. These buses enable access from edge contacts to distant components. These buses can also serve to augment the voltage or ground buses, and may be cut to length for particular applications.

Hobby Board H-PCB-1 \$4.99

PRECUT WIRE

Fast • Reliable • Economical

- No more cutting & stripping by hand
- Good, clean, uniform strip
- Cheaper than using bulk wire

What's New?

CALCULATORS

New 10 Digit
Desktop Calculator from Sharp

This new desktop, 10 digit business calculator featuring an item counter and grand total key has been introduced by Sharp Electronics Corp, 10 Keystone Pl, Paramus NJ 07652.

The new 4½ pound QS-1702 offers calculating and printing on standard roll paper. A 1 touch grand total key accumulates individual calculations. Specially designed minus equal and plus equal keys make the QS-1072 ideal for applications that require fast calculation. A constant add mode selector facilitates dollars and cents calculations. A 1 touch percent key, non-add and subtract total key for printing dates and codes, an item counter switch with a plus and minus and plus/only calculation and a fixed and floating decimal point selector are other major features of the QS-1702 calculator. ■

Circle 532 on inquiry card.

Handheld Printer and
Display Calculator

This rechargeable handheld printer and display calculator has been introduced by Texas Instruments Inc, POB 53, Lubbock TX 79408. The TI-5025 features a thermal printer and a large vacuum fluorescent display that can be used without the printer to conserve paper. The unit provides four basic functions as well as percent and 4 key memory. The TI-5025 operates with the same number entry system used in other TI handheld calculators. The thermal printer has fewer parts than impact printers, providing reliable, quiet, ribbonless operation.

The unit is priced at \$80 and comes with a charger and adapter, thermal paper and carrying case. Thermal paper rolls are available in packages of three for \$0.99. ■

Circle 533 on inquiry card.

Operator's Manual for
Texas Instruments
Programmable 58 and 59 Calculators

Personal Programming is written for owners of the Texas Instruments programmable 58 and 59 calculators. This manual gives a guided tour of keyboard basics, display control, algebraic functions, conversions, and statistical function on keys; a step by step discussion of programming as well as advanced programming; and a detailed analysis of all calculator keys showing the full operating limits of the machines in various calculating situations.

The price of this manual is \$12.95 plus tax and \$1 for shipping. For further information contact Texas Instruments Inc, POB 2500, Lubbock TX 79408. ■

Circle 534 on inquiry card.

North Star Utilities Package

With these programs the user can:

Read a basic program directly from a disc and list all variables appearing in the program (Listings can be made of variables versus line numbers or line numbers versus variables.)

Selectively print out any statement, function or command versus the line numbers that it appears in

Print out a "flow chart" of the basic program

This package is essential for examining and modifying basic programs. It is provided on a North Star Diskette for \$15.00.

• If you may be aware, publishers require advertisers to submit their ad copy 60 to 90 days prior to "press" date. That much lead time in a volatile market places, such as memory circuits, makes it extremely difficult to project future cost and availability. To obtain the best pricing on memory we have made volume commitments to our suppliers, which in turn affords us the opportunity to sell these circuits at the most competitive prices. Please contact us if you if you have a demand for volume state of the art memory products.

WORD PROCESSING TERMINAL

LAWYERS, BUSINESSMEN, This terminal, when properly interfaced to your computer, allows you the flexibility of generating computerized error free correspondence. Gives your clients and business associates the impression that each letter was personally typed for the recipient. Compose your correspondence and "fill-in" forms on your computer, edit on your screen and when your text is letter perfect instruct your computer to print an error free copy on your terminal. The heart of this terminal is the durable IBM Selectric Typewriter. If maintenance is ever required, the World Wide network of IBM service centers is at your disposal. The terminal is functional as a regular office typewriter when not performing computer work. Over the next several months 150 of these terminals will be removed from service, returned to the manufacturer, inspected and brought into perfect condition. Last Spring we offered for sale two-hundred Diable printers. Within three weeks every unit was sold. Don't pass this opportunity to purchase a word processing terminal at an excellent price. Selectric Terminal \$850 (FOR Los Angeles). Shipping to the East coast approx. \$35. Combined TRS-80 interface and power supply available. Documentation will be supplied to those individuals who want to do their own custom interfacing. Sorry, but credit cards will not be accepted on this purchase.

(213)679-9001

All products sold by California Digital are premium grade. Sorry, no C.O.D.'s. Orders are shipped the same day received. California residents add 6%. Foreign orders add 10%. Orders over \$25, when accompanied by payment, are shipped at our expense. Otherwise, please add \$2.

Ham Interface for the PET Microcomputer

The M-65 is a complete Morse code and radioteletypewriter (RTTY) system for the PET microcomputer. The hardware consists of a printed circuit board which plugs into a jack on the radio equipment and the PET user port. No external power is required. Both input and output circuits are optically isolated from the PET, minimizing radio frequency interference and spurious voltages. The board has a built-in side tone oscillator which connects to the speaker or headphone.

The software consists of two computer programs: Morse and RTTY, which are supplied on one audio cassette. Both programs are written in BASIC with machine language subprograms, and each requires 8 K bytes of programmable memory.

The M-65 is available in kit form for \$69.95 or fully assembled and tested for \$99.95. Contact Microtronics, 5943 Pioneer Rd, Hughson CA 95326. ■

Circle 653 on inquiry card.

S-100 Bus Compatible 4 Channel Digital to Analog Converter

This 4 channel digital to analog converter is available for use with Z-80 or 8080/8085 processors. The S-100 bus compatible digital to analog board has 12 bit resolution and uses plug-in hybrid digital to analog converters with ± 0.5 least significant bit accuracy. Power requirements are compatible with S-100 bus voltages: +8 V at 338 mA, +18 V at 122 mA, and -18 V at 156 mA.

The output is 10 V or 20 V full scale (strap selectable). The output range may be ± 5 V, ± 10 V, 0 to +10 V, or 0 to -10 V. An inversion strap is also provided for decreasing output with increasing input. Output current is 10 mA. Independent gain and offset adjustments are provided. Input coding may be either binary or 2's complement. Conversion speed is 3 μ s typical, and the converter slew rate is 20 V per μ s typical.

The price is \$495. Contact California Data Corp, 3475 Old Conejo Rd, Suite C10, Newbury Park CA 91320. ■

Circle 654 on inquiry card.

New Terminal Outputs Composite Video

The OE 1000 terminal is designed to interface to any microcomputer that has

a 300 bps serial data output port. It operates in the full duplex mode with either 20 mA current loop or RS-232 voltage swing. The OE 1000 outputs composite video for use with a modified television or a video monitor. The screen format is 16 lines by 64 characters. It has an upper and lower case mode or Teletype mode keyboard and will display 96 ASCII characters and 32 special characters. The OE 1000 has full cursor control, automatic scroll, erase to end of line, erase to end of screen, and clear screen.

The terminal is available as a kit for \$275 or assembled for \$350. Contact Otto Electronics, POB 3066, Princeton NJ 08540. ■

Circle 655 on inquiry card.

PerSci's New 4 Headed Voice Coil Floppy

A 4 headed flexible disk drive has been introduced by PerSci Inc, 12210 Nebraska Av, W Los Angeles CA 90025. The Model 299 diskette drive interfaces to 8080, 6800 and Z-80 systems, as well as minicomputers.

The Model 299 is a dual-headed, dual diskette drive, reading and writing both sides of two 8 inch diskettes. Data can be encoded in single or double density in IBM compatible soft sectored formats or expanded hard and soft sectored formats on IBM Diskette I, II, IID or equivalent media. The drive will store up to 1 M byte of data in IBM type format, 1.6 M bytes unformatted single density and up to 3.2 M bytes in unformatted double density encoding.

The operational tolerances required to achieve dual head, dual drive double density data handling are provided by PerSci's voice coil positioning system for an average seek time of 33 ms (including 0 settle time), five to seven times faster than stepper motor positioned drives. A full stroke 76 track seek is performed in 100 ms. The speed and the capacity of the drive are achieved while maintaining industry standard data reliability figures of 1 in 10^9 soft errors and 1 in 10^{12} hard errors.

The Model 299 features electric autoloader and can be unloaded by remote software control. Optical write protect secures the file.

The price is \$1595 in single unit quantities. ■

Circle 657 on inquiry card.

Digitizer for Small Computer Systems

Summagraphics has announced a new version of its Bit Pad, the digitizer for

small computer systems. The new Bit Pad configuration is Intel Multibus compatible. The Bit Pad can now be plugged into the Multibus along with Single Board Computers (SBC), memory and input/output (I/O) boards, peripherals and controllers.

All electronics are located on one SBC card. Operational control and status indication is provided from a small handheld console. The system also includes an 11 by 11 inch (27.94 by 27.94 cm) Bit Pad tablet and a date input stylus.

The basic Multibus Bit Pad configuration is priced at \$625. For further information contact Summagraphics, 32 Brentwood Av, POB 781, Fairfield CT 06430. ■

SOLID STATE SALES... *Announces a Breakthrough in Computer Technology*

A PICTURE MAY BE TAKEN BY OUR CAMERA,
STORED IN A COMPUTER IN REAL TIME AND THEN
DISPLAYED ON A CRT AT AN AFFORDABLE PRICE

VIDEO COMPUTER PROCESSING SYSTEM

GRAY LEVELS

THE CAMERA WILL TAKE BETWEEN 15 AND 100 FRAMES/SECOND. THE CAMERA CONNECTS TO THE PROCESSOR WITH SEVEN LINES. THIS INCLUDES VIDEO AND TIMING SIGNALS

APPLICATIONS

- CONTINUOUS SURVEILLANCE
- INSPECTION OF MOVING PARTS WITH PROPER STROBING
- VISUAL GRAPHIC INPUT TO A COMPUTER
- CHARACTER OR PATTERN RECOGNITION
- PICTURES MAY BE TAKEN DIRECTLY FROM A TV WITHOUT ELECTRICAL CONNECTIONS
- THE INTERFACE KIT MAY BE USED SEPARATELY AS A 128 x 128 16 LEVEL GRAPHIC DISPLAY

THIS REMARKABLE VP-1 COMPUTER/ INTERFACE KIT HAS THE FOLLOWING:

FEATURES

- IT PRODUCES COMPOSITE VIDEO OUTPUT IN A 128 x 128 MATRIX FROM A DIRECT MONITOR CONNECTION USING 8K OF MEMORY
- THE SYSTEM USES A STANDARD S 100 BUSS
- WILL NOT TIE UP COMPUTER SOFTWARE WHEN NOT ADDRESSED
- IT DISPLAYS CONTINUOUSLY WHEN NOT ADDRESSED
- IT MAY PRODUCE PSEUDO COLOR AND/OR GRAPHICS (UP TO 16 GREY LEVELS, 4 BIT BINARY)

OUR VP1 VIDEO SYSTEM CONSISTS OF THE FOLLOWING KITS:

- CCD 202C SOLID STATE VIDEO CAMERA KIT (CASE INCLUDED) . \$399⁰⁰
- VP-1 COMPUTER/VIDEO INTERFACE KIT (3 BOARDS) \$599⁰⁰
- ASSEMBLED 8K MEMORY BOARD (OPTIONAL) \$235⁰⁰

THIS VIDEO COMPUTER KIT CAN WORK WITH THE GE, REDICON, OR ANY OTHER 128 x 128 SENSOR CAMERA

Daisy Wheel Printers

- **SELECTRIC I/O TERMINALS** (by GTE/Information Systems). Both ASCII & IBM code versions with microcomputer interface software & hardware (RS-232 connector.) Cassette drive models permit up to 2400 baud data transfer rate as well as off-line data storage, use as memory typewriter, & use as data entry device for office personnel familiar with Selectric typewriters but not computers. Wide-carriage, interchangeable type spheres; optional built-in modem. All units cleaned, adjusted & warranted.
 - Model 5541 (IBM Correspondence code) \$695.00
 - Model 5550 (corres. code, built-in cassette drive) \$1195.00
 - Model 5560 (ASCII code, built-in cassette drive) \$1295.00
- **IBM SELECTRIC 725 TYPEWRITER I/O w/solenoids switches & magnet driver PCB** (from GTE/IS terminal) plus instructions for 8080 printer-driver interface hardware & software.
 - a) Typewriter mechanism complete, cleaned & adjusted \$375.00
 - b) Case from terminal & power supply (+24V, ±12V, +5V @5A). \$ 75.00
 - c) a & b plus output ASCII interface to mCPU 8-bit parallel port \$600.00
- **POS 103/202 "MIX or MATCH" MODEM:** BELL 103 and/or BELL 202 FREQUENCIES: Unique POS control design permits use in one housing of both Bell-compatible 103 (0 - 300 baud) and 202 (0 - 1200 baud) modem modules originally made by VADIC Corp. for a telephone company subsidiary. FEATURES: RS-232 serial interface, auto-answer, auto-dial, LED display, telephone line interface via acoustic coupler, manual DAA, or auto-answer DAA (sold separately.) FULLY ADJUSTED; no special tools required. 3,000 mile range over standard dial-up telephone lines.
 - POS 103 MODEM (with Auto Answer, Auto Dial) \$179.95
 - POS 202 MODEM (Half-Duplex with Reverse Channel) \$249.95
 - POS 202 MODEM (Half-Duplex w/Rev. Ch., Auto-Answer) \$279.95
 - POS 103/202 MODEM (Auto-Answer, Auto-Dial) \$399.95

- **DIABLO HYTYPE I Model 1200 Printer Mechanism:** used, complete and operational. Requires power supply, case & mCPU interface. 15 day return privilege - no other warranties. LIMITED QUANTITY! \$750.00
 - 6' Ribbon cable & connector for printer Main Logic PCB \$10.00
 - 14-pin Winchester connector & 18" power supply cable \$5.00
 - "As-is" spare printer PCB's for parts (Logic, Heat Sink, Control): ea. \$20.00
- **NEW TAPE DRIVE CONTROLLER for Microcomputer:** POS Version II tape drive controller is now available, permitting the 8080 or Z-80 owner to read and write standard IBM NRZ1 format tapes (as well as ASCII tapes) with the Ampex Model TMX tape drive described below. Controller is sold only with tape drive, comes complete with connector cables to CPU and software listing in 8080 assembly language (specify 2MHz or 4MHz system.)
 - Ampex TMX tape drive (used) with Version II Controller \$1500.00
- **AMPEX MODEL TMX TAPE DRIVE:** Ideal for microcomputerist who wants backup mass storage or access to IBM-type systems via standardized 2400 series 1/2" mag tape. Specs. 9-track, NRZ1 standard, 800 BPI, 12"/sec., 1200 ft. reels (11 megabyte capacity.) Drive is like new & comes with 8-bit CPU controller diagram (requires only 11 I/C's) & mCPU interface instructions. Prices. Drive & Documentation. \$750.00
 - Controller & cable for mCPU, assembled & tested \$250.00
- **DIGITAL CASSETTE DRIVE** (from GTE/IS Terminal): 1800 baud, 6"/sec. AC motor; fwd/rewnd circuitry plus tape head, no read/write electronics \$25.
- **FORMS TRACTORS,** Moore Variable width "Form A-Liner" for print terminals
 - a) Model 565P for 15" Carriage IBM Selectrics (new): \$50.00
 - b) Model K81 for QUME or DIABLO Hytype I or II printers (new) \$90.00
- **POWER SUPPLIES for Disk Drive, mCPU, tested under load shown.**
 - No. 519 (w/fan & AC cord): +5V reg., ±12V reg., +24V, @5A (10 lb. l.) \$29.95
 - LAMBDA No. LMEE5 w/OV protect: +5V reg. @ 25A (35 lb. l.) \$59.95

NO RISK! 15 DAY APPROVAL ON ALL MAIL-ORDERS

Full documentation included PLUS interface instructions where indicated. All equipment is shipped insured FOB Palo Alto within 14 days after check clears or COD order is received. Prices may change without notice.

HYBRID AUDIO POWER AMPLIFIERS

10 Watt - 20 Watt - 30 Watt - 50 Watt

- Multi-purpose (linear amplifiers for commercial and industrial applications.
- Less than 0.5% harmonic distortion at full power level.
- 1/2 dB response from 20 to 100,000 Hz.
- Single or split (dual) power supply.
- Rugged, compact and lightweight packages.
- Built-in current limiting for SI-1050G and efficient heat radiating construction.

TYPICAL CONNECTIONS

FOR SALE OR TRADE: Interdata Model 1 minicomputers. One complete and working, another lacking one board. 10 K core memory. \$400 or best offer. Gary Sawyer, 3952 Ash St, Irvine CA 92714, (714) 559-0243.

HELP: We have a SwTPC terminal (TV II) and would like to use it as a character generator for our TV studio. To do this, the terminal has to be synchronized externally. Can anyone send plans or ideas to do this by either stripping the present sync and adding the new, or by rebuilding portions of the terminal to accept external synchronization? Ken Pavlicek, Lyons Township High School, 4900 Willow Springs Rd, Western Springs IL 60558.

FOR SALE: TRS-80, LEVEL I, 4 K complete with video, power pack, cassette recorder, keyboard, original carton, manuals, and software. Perfect condition, I pay the freight. \$490. Mark Baiada, 271 Winding Ln, Cinnaminson NJ 08077. Call collect (609) 829-9310 after 6 PM.

FOR SALE: One Anderson Jacobsen 841 Terminal with 6 bit EBCO code 10 CPS. IBM Selectric keyboard. Good Condition. \$1000 FOB truck. Alan C Page, Green Diamond Forestry Service Inc, Blue Meadow Road, Belchertown MA 01007.

FOR SALE: 64 22 pin 3 level tin wire wrap sockets, \$8 per 16. 58 TMS-4060 4 K programmable memory chips, \$15 per 29 (bought surplus from Honeywell; never used but not guaranteed). Money order or cashier's check. James Phillips, 3435 N 75th Dr, Phoenix AZ 85033, (602) 849-8937.

FOR SALE: Heathkit H11 large scale integration computer with 4 K memory; serial and parallel interface, plus extended arithmetic chip. H10 paper reader/punch up and running and factory tested. Asking \$1900 and I will ship. Jim Thebeault, Rt 12 Box 94, Mansfield OH 44903, (419) 468-4700.

FOR SALE: Viatron Cassette decks, dual heads and motors, excellent foundation unit for mass storage system. Good documentation with all schematics. \$70 for pair or \$38 single units. Money order or certified check. Shipped post paid. V Caggia, 15 Lovell Dr, Wanaque NJ 07465, (201) 835-2477.

FOR SALE: SYM-1; new single board computer in original box with warranty. \$220. Carr, 13624 Neutron Rd, Dallas TX 75240.

FREE: Software and blank diskettes with the purchase of the minifloppy with the best cost/performance ratio available, the Micropolis Macrofloppy. Normally \$835 for drive, S-100 controller, cables, and blank diskettes new; the first check or money order over \$750 takes a factory assembled and tested system (only two months old and working beautifully, with the software and blanks added as a bonus). Contact David or Robert Mason, 503 Timber Ter, Houston TX 77024, (731) 681-3427 after 7 PM.

NEW UNCLASSIFIED POLICY

Readers who have equipment, software or other items to buy, sell or swap should send in a clearly typed notice to that effect. To be considered for publication, an advertisement must be clearly noncommercial, typed double spaced on plain white paper, contain 75 words or less, and include complete name and address information.

These notices are free of charge and will be printed one time only on a space available basis. Notices can be accepted from individuals or bona fide computer users clubs only. We can engage in no correspondence on these and your confirmation of placement is appearance in an issue of BYTE

Please note that it may take three or four months for an ad to appear in the magazine. ■

FOR SALE: September 1975 thru September 1976 BYTE. Best offer over \$75, all other BYTES to date. Make offer, C Ernst, 215 E Costilla Av, Littleton CO 80122, (303) 794-5667.

The first and second place winners of the December 1978 BOMB were "Some Facts of Life" by David J Buckingham (page 54) and "Life With Your Computer" by Justin Millium, Judy Reardon, and Peter Smart (page 45). These articles placed 2.17 and 1.21 standard deviations above the mean. First and second prizes of \$100 and \$50 will be sent to the authors.

Third place went to "Fast Fourier Transforms on Your Home Computer" by William D Stanley and Steven J Peterson (page 14), followed by "Chess 4.7 versus David Levy" by J R Douglas (page 84). ■

DOUBLE DENSITY

SOLID SAVINGS!

Now you can put your S-100 system solidly into a full-size, single/double density, 600K bytes/side disk memory for just \$1149 complete.

DISCUS/2D™ single/double density disk memory from Thinker Toys™ is fully equipped, fully assembled, and fully guaranteed to perform perfectly.

DISCUS/2D™ is a second generation disk memory system that's compatible with the new IBM System 34 format. The disk drive is a full-size Shugart 800R, the standard of reliability and performance in disk drives. It's delivered in a handsome cabinet with built-in power supply.

The S-100 controller utilizes the amazing Western Digital 1791 dual-density controller chip . . . plus power-on jump circuitry, 1K of RAM, 1K of ROM with built-in monitor, and a hardware UART to make I/O interfacing a snap.

The DISCUS/2D™ system is fully integrated with innovations by designer/inventor George Morrow. Software includes BASIC-V™ virtual disk BASIC,

DOS, and DISK-ATE™ assembler/editor. Patches for CP/M* are also included. CP/M†; MicroSoft Disk BASIC and FORTRAN are also available at extra cost.

DISCUS/2D™ is the really solid single/double density disk system you've been waiting for. We can deliver it now for just \$1149. And for just \$795 apiece, you can add up to 3 additional Shugart drives to your system. Both the hardware and software are ready when you are.

Ask your local computer store to order the DISCUS/2D™ for you. Or, if unavailable locally, write Thinker Toys™ 1201 10th St., Berkeley CA 94710. Or call (415) 524-2101 weekdays, 10-5 Pacific Time. (FOB Berkeley. Cal. res. add tax.)

*CP/M is a trademark of Digital Research.

The Microcomputers you should take seriously.

The C3 Series is the microcomputer family with the hardware features, high level software and application programs that serious users in business and industry demand from a computer system, no matter what its size.

Since its introduction in August, 1977, the C3 has become one of the most successful microcomputer systems in small business, educational and industrial development applications. Thousands of C3's have been delivered and today hundreds of demonstrator units are set up at systems dealers around the country.

Now the C3 systems offer features which make their performance comparable with today's most powerful mini-based systems. Some of these features are:

Three processors today, more tomorrow.

The C3 Series is the only computer system with the three most popular processors — the 6502A, 68B00 and Z-80. This allows you to take maximum advantage of the Ohio Scientific software library and the tremendous number of programs offered by independent suppliers and publishers. And all C3's have provisions for the next generation of 16 bit micros via their 16 bit data BUS, 20 address bits, and unused processor select codes. This means you'll be able to plug a CPU expander card with two or more 16 bit micros right in to your existing C3 computer.

Systems Software for three processors.

Five DOS options including development, end user, and virtual data file single user systems, real time, time share, and networkable multi-user systems.

The three most popular computer languages including three types of BASIC

plus FORTRAN and COBOL with more languages on the way. And, of course, complete assembler, editor, debugger and run time packages for each of the system's microprocessors.

Applications Software for Small Business Users.

Ready made factory supported small business software including Accounts Receivable, Payables, Cash Receipts, Disbursements, General Ledger, Balance Sheet, P & L Statements, Payroll, Personnel files, Inventory and Order Entry as stand alone packages or integrated systems. A complete word processor system with full editing and output formatting including justification, proportional spacing and hyphenation that can compete directly with dedicated word processor systems.

There are specialized applications packages for specific businesses, plus the vast general library of standard BASIC, FORTRAN and COBOL software. **OS-DMS, the new software star.**

Ohio Scientific has developed a remarkable new Information Management system which provides end user

intelligence far beyond what you would expect from even the most powerful mini-systems. Basically, it allows end users to store any collection of information under a Data Base Manager and then instantly obtain information, lists; reports, statistical analysis and even answers to conventional "English" questions pertinent to information in the Data Base. OS-DMS allows many applications to be computerized without any programming!

The new "GT" option heralds the new era of sub-microsecond microcomputers.

Ohio Scientific now offers the 6502C microprocessor with 150 nanosecond main memory as the GT option on all C3 Series products. This system performs a memory to register ADD in 600 nanoseconds and a JUMP (65K byte range) in 900 nanoseconds. The system performs an average of 1.5 million instructions per second executing typical end user applications software (and that's a mix of 8, 16 and 24 bit instructions!).

Mini-system Expansion Ability.

C3 systems offer the greatest expansion capability in the microcomputer industry, including a full line of over 40 expansion accessories. The maximum configuration is 768K bytes RAM, four 80 million byte Winchester hard disks, 16 communications ports, real time clock, line printer, word processing printer and numerous control interfaces.

Prices you have to take seriously.

The C3 systems have phenomenal performance-to-cost ratios. The C3-S1 with 32K static RAM, dual 8" floppies, RS-232 port, BASIC and DOS has a suggested retail price of under \$3600. 80 megabyte disk based systems start at under \$12,000. Our OS-CP/M software package with BASIC, FORTRAN and COBOL is only \$600. The OS-DMS nucleus package has a suggested retail price of only \$300, and other options are comparably priced.

To get the full story on the C3 systems and what they can do for you, contact your local Ohio Scientific dealer or call the factory at (216) 562-3101.

C3-B wins Award of Merit at WESCON '78 as the outstanding microcomputer application for Small Business
