

The Raphidophytes – the enigmatic class!

Carmelo R. Tomas

University of North Carolina Wilmington

Center for Marine Science

5600 Marvin K. Moss Lane

Wilmington, NC 28409 USA

Raphidophytes

C. antiqua

C. ovata

Gonostomum

C. marina

Fibrocapsa.

H. akashiwo

Haramonas

Vacuolaria

Kingdom – Chromista

Infrakingdom – Heterokonta

Phylum Ochrophyta

Class Raphidopyceae – M. Chadeffaud ex P.C. Silva 1980

Orders – Raphidomonadales Norris 1982

Chattonellales Throndsen 1995

Systema Naturae 2000/Classification

Raphidophytes

```
graph TD; A[Raphidophytes] --> B[Green Raphidophytes]; A --> C[Golden Brown Raphidophytes];
```

Green Raphidophytes

Vaucheriaxanthin derivatives

Freshwater

Vacuolaria

V. virescence

V. depressum

Gonyostomum

G. semen

G. latum

Merotrichia

M. capitata

Golden Brown Raphidophytes

Fucoxanthin dominated carotenoids

Brackish/Marine

Heterosigma

H. akashiwo = *H. carterae*

Chattonella

C. subsalsa

C. antiqua (*C. harima*??)

C. ovata

C. marina

C. globosa

C. minima

Fibrocapsa

F. japonica (*Chattonella japonica*)

Haramonas

H. dimorpha

H. viridis

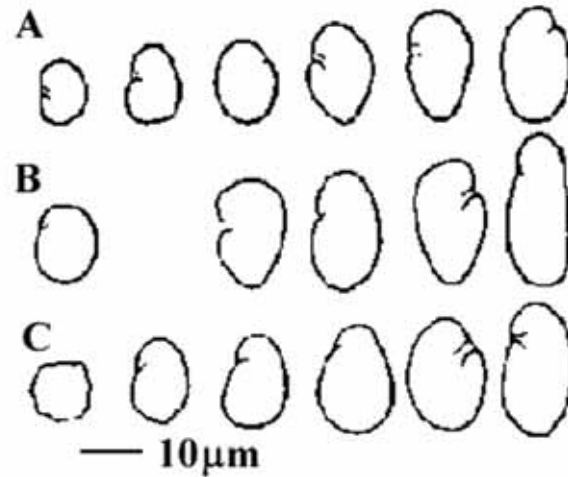

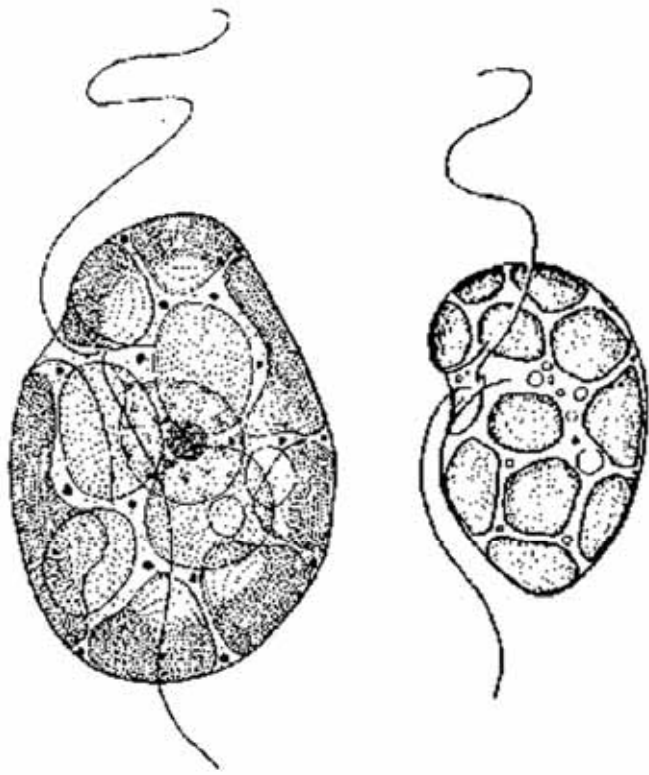

Vacuolaria

Gonyostomum

Merotrichia

Heterosigma akashiwo
(Hada) Hada

Photomicrographs by Ichiro Imai
 and drawings by Yoshiaki Hara
 and Mitsuo Chihara

- 3 > 25 μm long
- 4-18 μm wide
- Shape – varying
- 2 subapical heterokont flagella
- Chloroplasts 3 - ~ 27
- Forms benthic stage and cysts
- Accumulates in surface layers under strong light
- Produces allelopathic substances
- Toxins – reactive oxygen species, hemolytic substances, neurotoxins, ichthyotoxins and unsturated fatty acids

Heterosigma akashiwo - **What's in a name?**

Vulgar names –

Pot shard flagellate –Pratt for Narrangasett Bay

Potato – morphology within a sack of potatoes -Tomas

Corn Flake flagellate

Pre 1980 - literature

For many years mistakenly called *Olsithodiscus luteus*

Plymouth Clone – 12A, 239

Guillard Collection (WHOI) Olisth

Narrangasett Bay Clones – OLMS, O. luteus

Morphology

Heterosigma akashiwo
(Hada) Hada

Photomicrographs
by Yoshiaki Hara

WESTPAC-HAB
IOC Harmful Algal Bloom Programme

T0007

SEM – Stazione Zoologica “A. Dohrn” di Napoli

Chattonella subsalsa

30-50 μm long

10-30 μm wide

Shape mostly pyriform

Flagella 2 heterodynamic
emerging subapically in
depression.

Chloroplasts – many, golden
brown

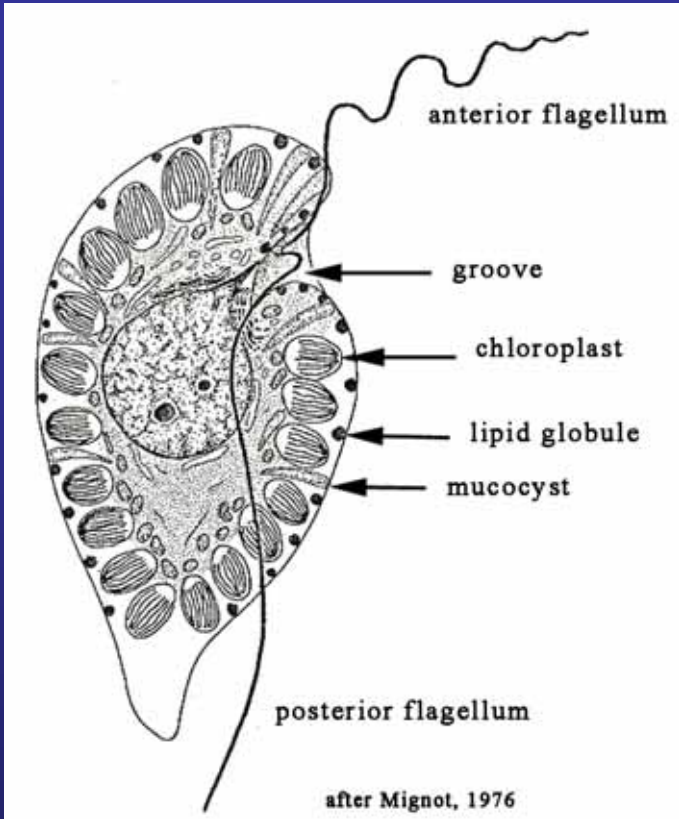

Cyst formation?

Toxicity unknown –

Can be confused with *Chattonella marina* although EM features differ.

Most common bloom species in coastal U.S. often associated with other raphidophytes.

Separated from *C. marina*, *C. antiqua* and *C. ovata* by molecular sequences.

Chattonella marina
(Subrahmanyam) Hara et Chihara

Photomicrographs by Ichiro Imai and Sadaaki Yoshimatsu,
and drawings by Yoshiaki Hara and Mitsuo Chihara

Chattonella marina

30-70 μm long

20-30 μm wide

2 flagella

Toxins – neurotoxins

ROS

Hemolytic Agents

20 μm

Chattonella marina

Chattonella marina

C. marina

C. subsalsa

CCMP2050

20 μm

Chattonella antiqua

20 μ m

Photomicrographs by Yoshiaki Hara
and Sadaaki Yoshimatsu

WESTPAC-HAB T0010
IOC Harmful Algal Bloom Programme

Chattonella antiqua (Hada) Ono

Yellow Tail – Seto Inland Sea, Japan

traces of bloom appeared due to water mixing by fishing boat

Red tide by *Chattonella antiqua* and consequent mass mortality of aquaculture fish, *Seriola quin.* (Seto Inland Sea, August 1977)

WESTPAC-HAB R0003

Cultured tuna – South Australia

Mass mortality of yellowtail, *Seriola quinqueradiata*, cultured in cages by a red tide of raphidoflagellate *Chattonella antiqua* (Seto Inland Sea, Aug.1977)

WESTPAC-HAB R0004-2

20 μ m

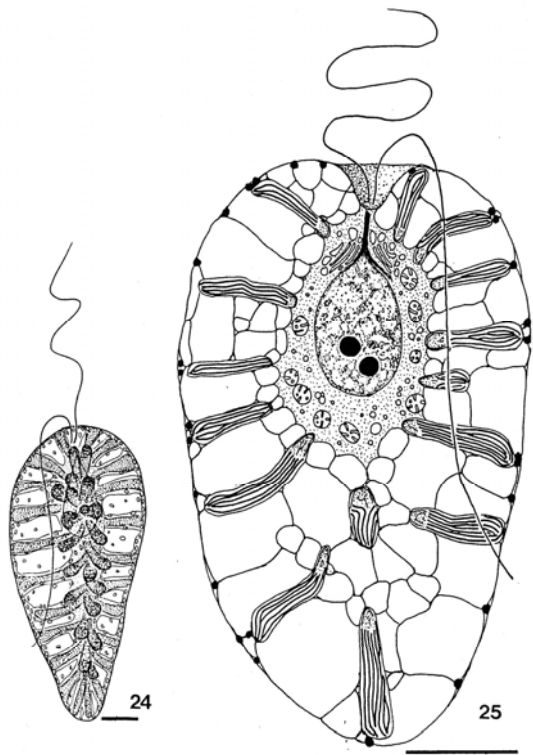

Fig. 24-25. *Chattonella ovata*. 24: Drawing of a motile cell. 25: Drawing showing the features of a motile cell based on the observations using electron microscopy. Scale bars = 10 μ m in Figs. 24, 25.

Chattonella ovata

Chattonella ovata

C. ovata

C. marina

C. antiqua

C. subsalsa

Fibrocapsa japonica

20 – 30 μm Long

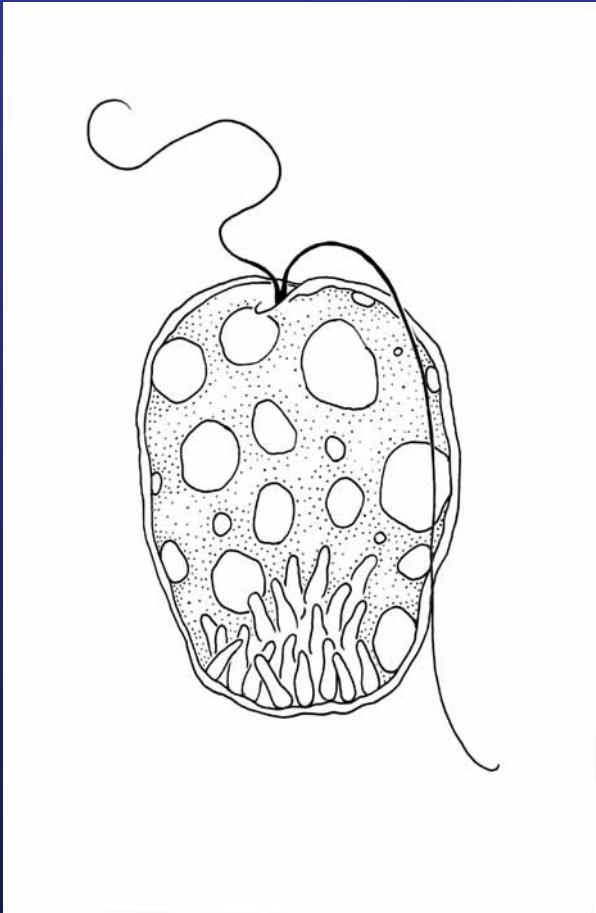

30 – 50 μm Wide

Shape – flattened, ovate, oval or round

Flagella – 2 heterokont – one long posterior and shorter anterior

Emerge from anterior furrow.

Mucocysts – prominent particularly in posterior of cell

Fibrocapsa japonica

Haramonas dimorpha

Heterosigma or Chattonella????

Which species???

Does this help??

So much for morphology!!!!

What about pigments????

Table 3. Pigment comparison of *Chloromorium toxicum* with other Xanthophyceae, Raphidophyceae and Dictyochophyceae. Pigments are in order of retention in chromatograms. All species contain Chlorophyll *a* and is not indicated

Class	Species	Culture origin	Chl <i>c</i> ₁ + <i>c</i> ₂	Chl <i>c</i> ₃	Hetero	19' But	Fuco	19' Hex	Viola	Dd	Diato	Morum	Vaucher	Zea	β,β-carot
Xanthophyceae	<i>Vaucheria germinata</i>	CCMP	+		+					+++	+		++		+
	<i>Vaucheria bursata</i>	CCMP	+		+					+++	+		++		+
	<i>Tribonema bombicina</i>	CCMP	+		+					+++	+		++		+
	<i>Tribonema aequale</i>	CCMP	+		+					+++	+		++		+
Green	<i>Vacuolaria virescence</i>	UTEX2237	+		+					+			++**		
Raphidophyceae	<i>Gonyostomum semens</i>	CMSTAC	+		+					+			++**		
Brown Raphidophyceae	<i>Chatonella antiqua</i>	Kagawa	++				++		++	+				+	+
	<i>Chatonella ovata</i>	Kagawa	++				+++		++	+				+	+
	<i>Chatonella marina</i>	Kagawa	++				+++		++	+				+	+

Genetic Analysis

Bowers *et al.* 2006

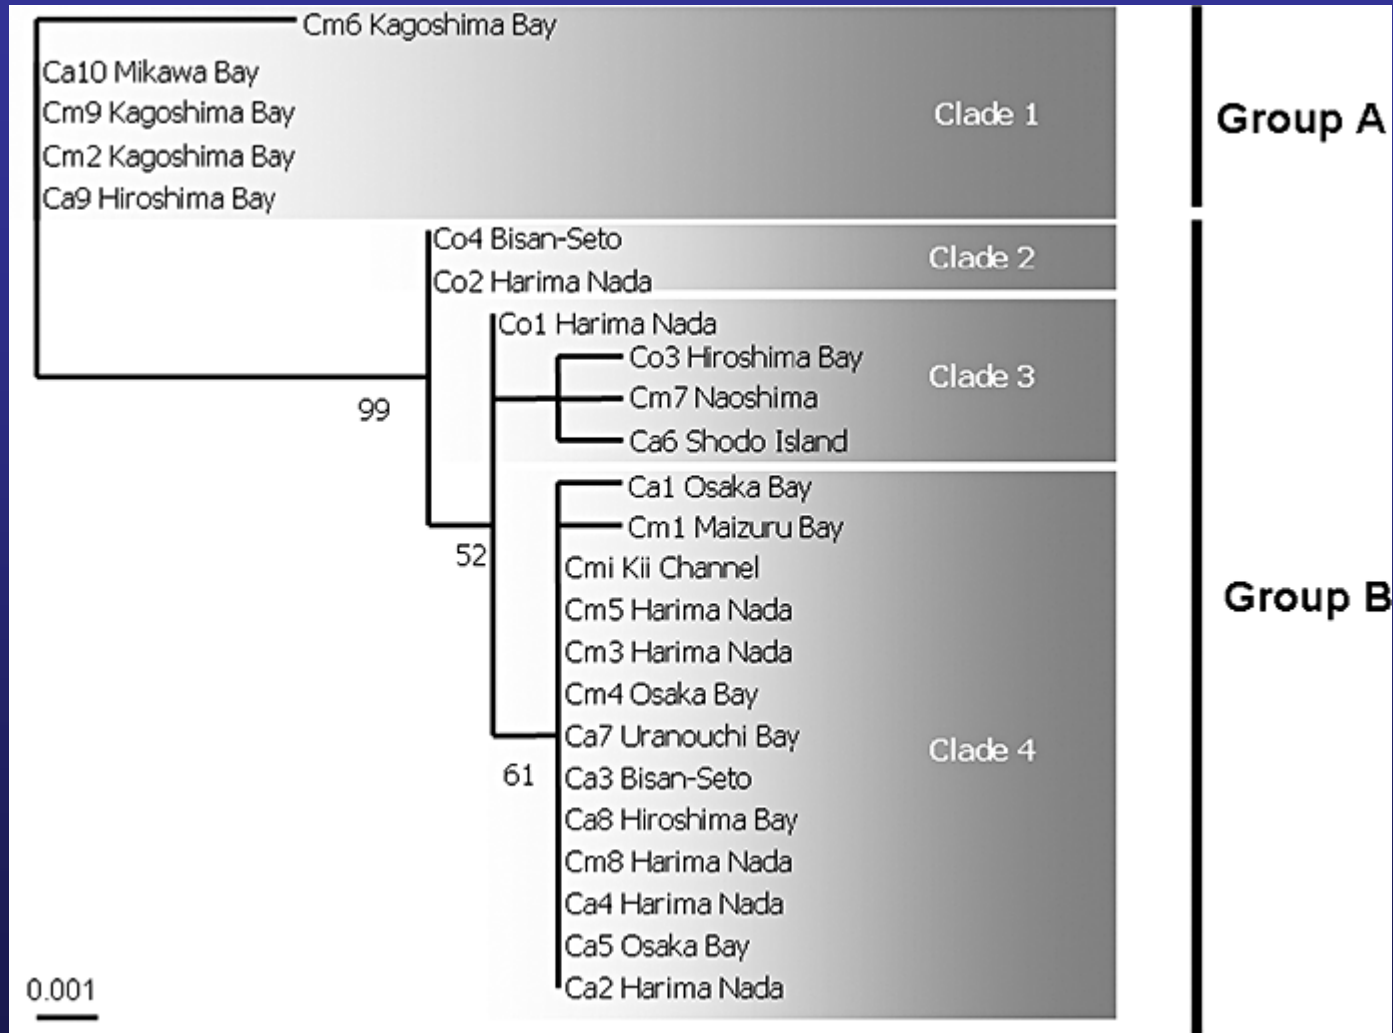

- “We sequenced the nuclear encoded 18s locus of a panel of raphidophyte cultures...Isolates of *C. antiqua*, *C. ovata*, *C. marina*, and *C. sp.* had 100% sequence similarity and shared 99% similarity to the *C. subsalsa* isolates.”
- “We partially sequenced the plastid encoded 16S locus of several raphidophyte...cultures. The members of the *C. marina/antiqua/ovata/sp.* complex were identical in the 16S plastid locus.”

Genetic Analysis

Kamikawa *et al.* 2007

- “When all 24 sequences were compared, a total of 16 variant sites were detected in 939 bp of *cox2*-coding, *cox1*-coding, and intergenic regions...High variation in mtDNA was revealed, and sequence analysis of the mt genome data from *C. antiqua*, *C. marina*, [and] *C. ovata*... demonstrated considerable intraspecific divergence among the [three] species.”

Mitochondrial Genetic Homology

KAMIKAWA, R, MASUDA, I, OYAMA, K, YOSHIMATSU, S & SAKO, Y Genetic variation in mitochondrial genes and intergenic spacer region in harmful algae *Chattonella* species. *Fisheries Science* **73** (4), 871-880.

Preserved Samples – So who are they?

Take home message!!!!

Hint #1. Look at live cells!

Hint #2. Culture unknown cells if possible!

Raphidophyte – imposters

Olisthodiscus luteus ???? *Heterosigma akashiwo* ????

O. luteus = *H. akashiwo* in literature prior to 1984.

Chattonella verruculosa

Japan – Pseudochattonella

Japan – Verrucophora verruculosa

North Sea – Verrucophora farsimens

Chattonella verruculosa Hara et Chihara
(spherical form)

**Chattonella aff. verruculosa – Kattegat-Skagerrak area
Swedish, Norwegian Coastal Areas and North Sea**

Photo's by Mats Kuylenstierna

Swedish Meterological and Hydrological Institute Reports Oceanography 32

***Chattonella aff. verruculosa* now redescribed as *Verrucophora farcimen* Eikrem, Edvardsen et Thronnsen, gen et sp. nov.**

Chattonella verruculosa – Japan

Chattonella verruculosa – New Zealand

Chattonella aff. verruculosa – North Sea (Skagerrak)

Chattonella cf. verruculosa – Delaware, USA (not C.v. – C. Tomas)

Dictyocophyceae

Recent publications:

Pseudochattonella verruculosa –

Hosoi-Tanabe, Shoko; Honda, Daisuke; Fukaya, Sachiko; Otake, Isamu;
Inagaki, Yuji; Sako, Yoshihiko. 2007. *Phycological Research*. 55:185-192(8)
