System Power States

- CHP3_SLPS1* S1, Powered-On-Suspend(POS) : In this state, all clocks(except the 32.768KHz clock) are stopped. The system context is maintained in system DRAM. Power is maintained to PCI, the CPU, memory controller, memory, and all other critical subsystems. Note that this state does not preclude power being removed from non-essential devices, such as disk drives. During this state, CPU can be selected for either Deep Sleep or Deeper Sleep.
- CHP3_SLPS3* S3, Suspend-To-RAM(STR) : The system context is maintained in system DRAM, but power is shut off to non-critical circuits. Memory is retained, and refreshes continue. All clocks stop except RTC clock.
- CHP3_SLPS4* S4, Suspend-To-Disk(STD) : The Context of the system is maintained on the disk. All power is then shut off to the system except for the logic required to resume. Externally appears same as S5, but may have different wake events.
- CHP3_SLPS5* S5, Soft Off(SOFF) : System context is not maintained. All power is shut off except for the logic required to restart. A full boot is required when waking.

Refer To Thermal Sensor Layout Guidelines.

- Place the Thermal Sensor close to a remote diode.
- Keep traces away from high voltage (+12V bus)
- Keep traces away from fast data buses and CRT signal.
- Use recommended trace widths and spacings (10mil)
- Place a ground plane under the traces.
- Use guard traces flanking DXP and DXN and connecting to GND

STRAP DEFINITIONS FOR THE RS600M	
STRAP PIN	DESCRIPTION
DACHSYN	Enable/Disable integrated graphics. 0 : Enable integrated graphics 1 : Disable integrated graphics
STRP_DATA	Debug strap configuration. This strap should not be set to "0" on production boards. 0 : Select Memory Channel A to be a debug bus 1 : Read debug straps from an external EEPROM, or disable debug mode when an EEPROM is absent.
DACVSYN	Select configuration of the integrated graphics engine. 0 : Reserved 1 : Required setting for the RS600M
DDC_DATA	Select DDR2 or DDR3 signalling level for the memory interface. 0 : DDR3. On DDR3, it is necessary to put an isolation FET in series with the pull-up resistor on this strap to separate it from the I2C circuit during an NB reset 1 : DDR2

7) Battery Use Time

Check the following check lists for systems where the battery use time is too short to diagnose problems.

(1) Check the battery

Check if the battery is out of order referring to the Battery check program distributed to Service Centers and the 'Battery Check Manual' included in the 'Note-PC A/S Guide'.

1. Battery Check List

Please mark “” in the box () of each applicable items, after checking the battery status with the “battery checking program”

1. Does the battery communicate normally with system?

- PASS
 FAIL

2. Is the battery charged normally?

- PASS
 FAIL

3. Is the battery discharged normally?

- PASS
 FAIL

4. Is the battery still in warranty?

- Excess than 6 months : Out of warranty
 Excess than 300 Cycles : Out of warranty
 Less than 6 months : PASS
 Less than 6 months : FAIL

2. Criteria for each of the check lists.

1. Does the battery communicate normally with system?

PASS

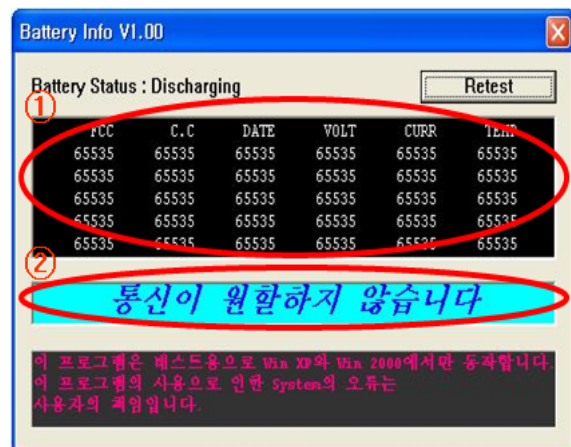

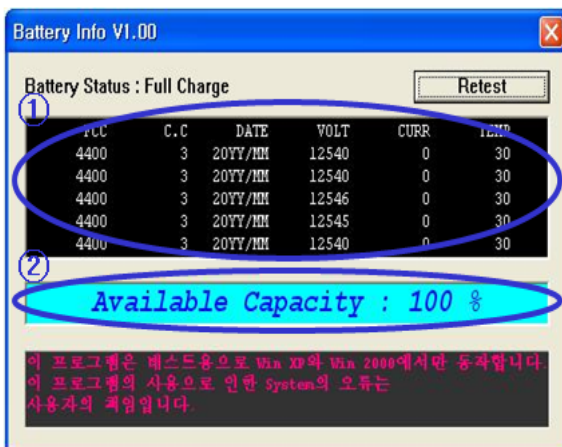

FAIL

①: Data displayed in the data window.

①: The code 65535 displayed

②: Available capacity displayed : 0 ~ 100%

②: Displayed the error message in Korean

5. Troubleshooting

4. Is the battery still in warranty?

Excess than 6 months : Out of warranty

Excess than 300 cycles : Out of warranty

Warranty period : Within 6 months after sales date, more than 60% of initial electric capacity after 300 cycles.

*** Reference :** If a battery is out of warranty, the battery can not be considered as “defected”. So if a customer requests to exchange his battery in this case, the battery should be provided **onerously with sales price**. So please persuade customer to use continuously his battery, with the explanation of effective capacity of his battery, if the battery have no defect but only small decrease of capacity.

Less than 6 months : PASS

Less than 6 months : FAIL

①Please refer to “Capacity Standard Table” (or ②Capacity Standard Graph). Please judge Pass or Fail after checking the sales date of a battery. Pass, if the capacity of the battery is over than the value of corresponded date of “Available Capacity” column in the Table. Fail, if the capacity is lower than the value.

*** Reference :** The battery capacity can have individual error according to the user’s circumstance of the battery. So it is recommended that the battery should be checked (with Battery Check Program) after calibration (Smart Battery Calibration: Full charge/discharge or Full discharge/charge)

5. Troubleshooting

(2) Check the battery use environment

1. Generally, the battery usage time in advertisements by notebook manufacturers refers to the maximum battery use time. Since the system specifications and the usage environment may differ, the user's battery usage time may differ from the advertisement even if there is no problem with the system.
2. Conditions for the company's maximum battery use time
 - a. Minimum LCD brightness, base system, the wireless LAN R/F is turned off, BatteryManager-Maximum Battery Mode
 - b. Measuring Tool: BatteryMark v.4.0.1
3. If a customer complains about the battery usage time, let them know that the battery usage time may differ depending on the model specifications and the usage environment and recommend the following usage environment for longer battery time.
 - a. Use the company's power-saving program, BatteryManager, and set BatteryManager to Maximum Battery Mode.
 - b. LCD brightness: Set to the minimum level as long as the user does not experience inconvenience.
 - c. Disable unnecessary devices
