In response to Smart City and Industry 4.0 trends, Advantech has established three business groups, namely Embedded Design-In, Industrial-IoT, and Smart City Solutions. These three are aligned to three target markets: Embedded Design-In serves Industrial Equipment Manufacturers (IEMs), and is equivalent to Advantech's central kitchen. Industrial-IoT serves Industry 4.0 and IoT-related industries, and Smart City Solutions serves smart city solution providers in various fields.

In order to cater to market trends, Advantech has undergone significant transformations, from products to solutions, from regional to global consolidation, and has also implemented vertical-market oriented (sector-lead) concepts in an effort to optimize operations and enhance resource-integration benefits.

The Industrial Internet of Things (IIoT)

Advancing Key Growth Areas in Industry 4.0, Energy & Environment and Transportation

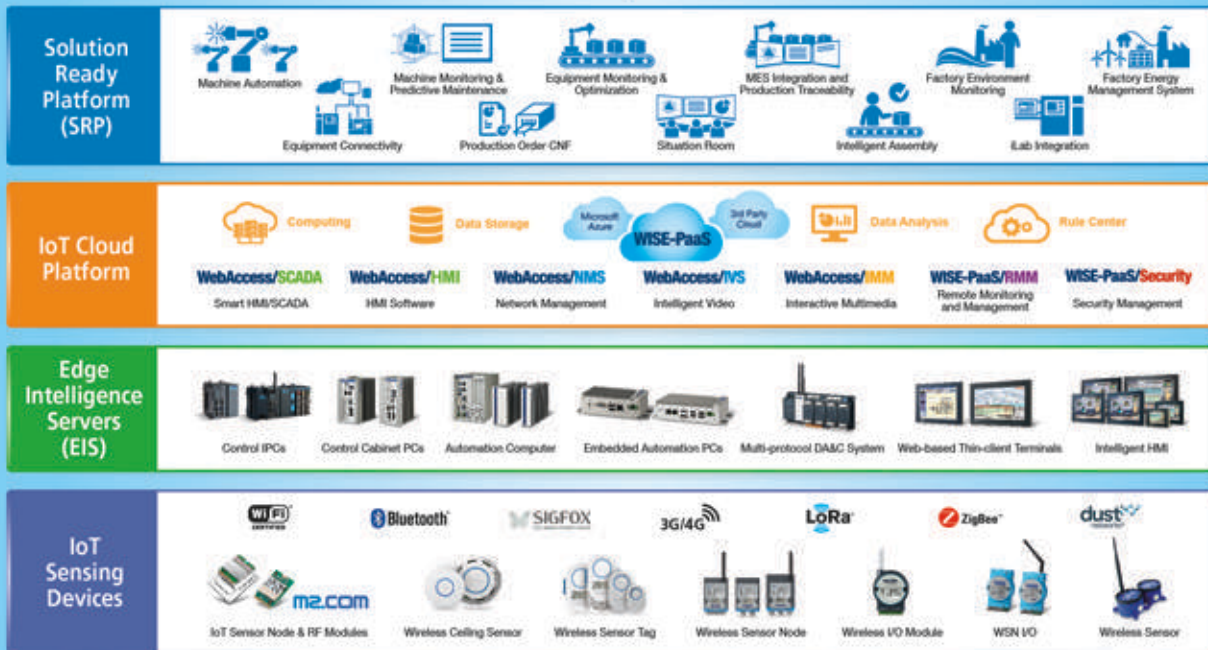

The Industrial Internet of Things (IIoT) is set to open up a new era of industrial applications, booming opportunities and economic growth. The IIoT is a matrix of networks that connects people with data and intelligent machines in order to optimize industrial operations, productivity and efficiency. To support the growth of IIoT, Advantech provides products and services that build the IIoT infrastructure and strengthen their offerings with four layers including, IoT Sensing Devices, Edge Intelligence Servers (EIS), IoT Cloud Platforms, and Solution Ready Platform (SRP). Advantech is devoted to leveraging its computing, data acquisition and networking competence to provide customer-centric products and solutions for key growth areas in Industry 4.0, Energy & Environment, and Transportation. The following are our highlights for these three key areas.

Demystifying Industry 4.0: Making iFactory and iMachinery Accessible

To realize Industry 4.0, Advantech has initiated three strategic phases. The first phase is the implementation of equipment connectivity: devices, machines, production lines and factories are all connected and therefore data acquisition, as well as process visualization can be fulfilled. In the second phase, data integration and valued-added products and services are introduced for integrated manufacturing. The final phase is to accelerate intelligent innovation and big data analysis which ultimately leads to a business model revolution. With Industry 4.0, Advantech enables network-connected iFactory and iMachinery to boost the transformation of smart manufacturing.

In the realm of intelligent machines, Advantech focuses on Ethernet based solutions as well as integrated motion control and machine vision for machine automation applications. Advantech develops products for ARM/DSP/FPGA processors for specific industries, and also provides Solution Ready Platforms (SRP) to help system integrator partners quickly develop different applications for end customers. Through various platforms integrated with motion and machine vision solution modules, Advantech fulfills demands in new machine automation projects and positions itself as a leading PC-based MA solution provider.

Advantech Industry 4.0 Architecture

Energy & Environment

Introduction

Advantech WebAccess is a 100% web-based SCADA software solution that also serves as an IIoT platform by providing open interfaces for developing IoT applications aimed at various vertical markets. In addition to traditional SCADA functions, WebAccess features an intelligent dashboard to facilitate cross-platform, cross-browser data analysis and provide a user interface based on HTML5 technology. Furthermore, in addition to built-in widgets, WebAccess is also equipped with Widget Builder, which enables system integrators to design unique widgets and applications.

The basic components of WebAccess are as follows:

1. **Project Node:** This is the project development platform of WebAccess and serves as a web server for all clients to connect to development projects as well as remotely monitor and control the system. All system configuration settings, project database files, and graphics are stored in the project node.
2. **SCADA Node:** This node enables real-time communication with automation equipment and equipment control via serial, Ethernet, or proprietary communication using the various built-in device drivers. The SCADA node not only manages local controls and monitoring, but also provides real-time data to all remote clients.
3. **ViewDAQ Client:** Through Microsoft Internet Explorer's ActiveX control, ViewDAQ Client monitors and controls the SCADA node. The client first connects to the project node to obtain the address of the SCADA node, then communicates directly with the SCADA node using proprietary communications over a TCP/IP connection. Data is displayed in real-time as dynamically animated graphics and presented along with real-time historical trends and alarm information. The ViewDAQ Client can be used to acknowledge alarms and change set-point and status data, as well as other information.
4. **Dashboard Client:** This enables users to access the dashboard server through any browser on any platform, such as a computer, pad, or smartphones equipped with iOS, Android, or Windows.

Feature Details

Supports Private/Hybrid Cloud Architecture

WebAccess is a 100% web-based HMI and SCADA software with private/hybrid cloud software architecture. WebAccess offers large equipment vendors, SIs, and enterprises the ability to access and manipulate centralized data and to configure, change/update, or monitor equipment, projects, and systems all over the world using a standard web browser. With cloud-based WebAccess, large amounts of device data are uploaded to the cloud via the MQTT web socket protocol. Predefined nodes can be integrated with Node-RED to provide a visual IIoT tool, enabling data to be displayed on the cloud dashboard and Microsoft PowerBI. WebAccess also offers plug-and-play functionality for synchronizing data configuration between local and cloud devices, thereby enabling online maintenance and modification.

Business Intelligence Dashboard

WebAccess provides an HTML5-based dashboard as the next generation of WebAccess HMI. SIs can use the dashboard editor to create a customized information page featuring analysis charts and diagram widgets. The built-in widget library contains numerous widgets, such as trends, bars, alarm summary, map widgets, etc., and the included Widget Builder can be used to create unique widgets. After dashboard screens have been created, end users can access the data using the dashboard viewer via various platforms, such as Explorer, Safari, Chrome, and Firefox, and on various devices, including PCs, Macs, tablets, and smartphones, for a truly convenient viewing experience.

Widget Builder

Widget Builder is a widget development tool based on HTML5 and featuring an intuitive UI. Users can edit widgets remotely from any location using any browser and at any time. Widget Builder provides users with various design tools for creating widget components and drawing shapes and objects with a wide range of animations. Additionally, all widgets can be easily imported and exported for reuse.

Open Interface

WebAccess opens three types of interfaces, including RESTful API and SignalR, for various uses. First, WebAccess provides a web service interface for partners to integrate WebAccess data into apps or application systems. Second, a pluggable widget interface is opened for programmers to develop widgets and run WebAccess Dashboard. Finally, WebAccess opens WebAccess API, which is a DLL interface for programmers to access the WebAccess platform and develop Windows applications. By supporting these interfaces, WebAccess serves as an IIoT platform for developing IIoT applications in various vertical markets.

Integrated with WebAccess/IVS

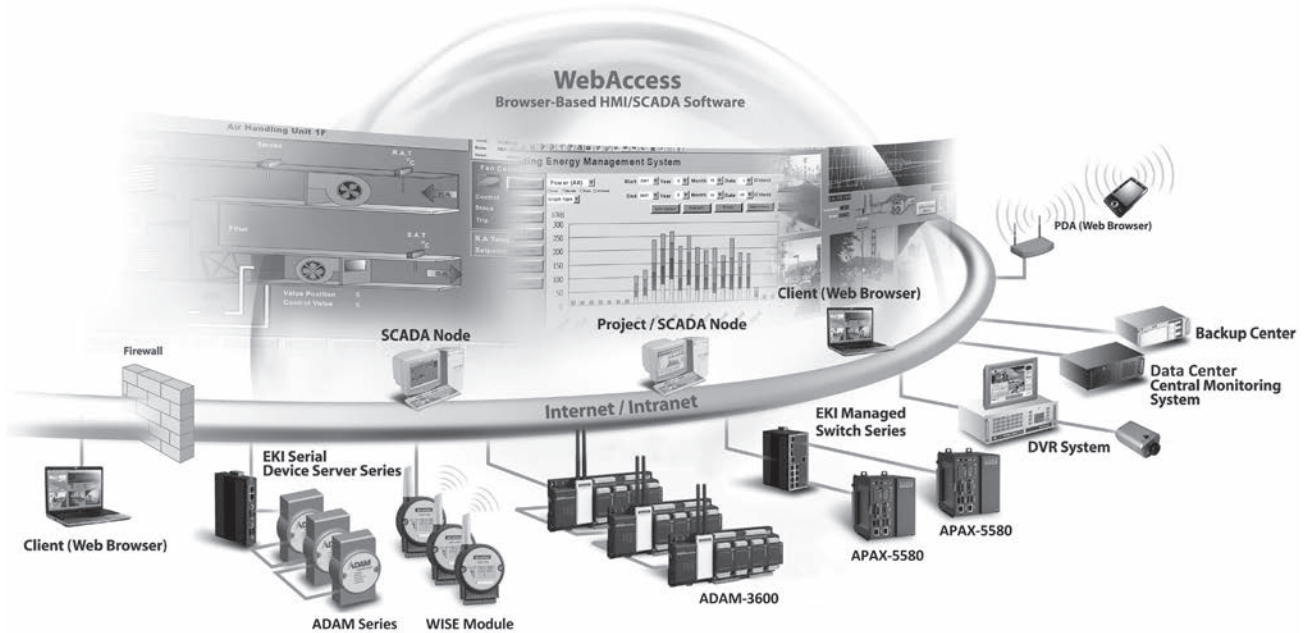

WebAccess is tightly integrated with WebAccess/IVS to provide a comprehensive video management solution that supports real-time monitoring and video playback. With this intelligent video surveillance system, events can be displayed as alarms and video playback performed accordingly.

Integrated with WebAccess/NMS

WebAccess/NMS is a network device management system based on HTML5. WebAccess can be easily integrated with a web interface. Additionally, with WebAccess graphics, users can monitor the real-time status of network devices via the network topology and search the event logs.

Integrated with WISE-PaaS/RMM

Previously, WebAccess only supported sensor and device monitoring. Now, with the integration of WISE-PaaS/RMM, WebAccess supports monitoring of the equipment and platform status, such as the CPU temperature, CPU usage, and board temperature, thereby enabling remote equipment monitoring.

Integrates Google Maps and GPS Tracking

WebAccess integrates real-time data of each geographical site with Google Maps and GPS location tracking. Regarding remote monitoring, users can remotely view the building energy consumption, field production rate, and highway traffic flow as well as the relevant alarm status. By right clicking on Google Maps or entering the coordinates of the target location, users can create a marker for the target and associate the real-time data of three sites with a display label. Furthermore, this function can be integrated with GPS modules to track the marker location in Google Maps, enabling the data to be shared with relevant vehicle systems.

WebAccess Express - The Auto-Configuration Tool

Advantech's WebAccess Express is an automated graphical remote control application program for making device information available online with a single click. WebAccess Express automatically discovers the ADAM and EKI modules on the network and serial ports, generates a database, and makes real-time data available online with pre-built monitoring graphics. WebAccess Express also support remote monitoring functions by allowing users to communicate and exchange data with SNMP, DiagAnywhere Server, or SUSI 4.0 APIs and check the CPU health, memory, temperature, and voltage of target machines. By integrating SNMP, DiagAnywhere, or SUSI API drivers, users can configure WebAccess to emit an alarm if any abnormal or suspicious data is detected.

Multiple Driver Support

WebAccess can support hundreds of devices. In addition to Advantech I/Os and controllers, WebAccess supports all major PLCs, controllers, and I/Os, such as those by Allen Bradley, Siemens, LonWorks, Mitsubishi, Beckhoff, and Yokogawa. For vertical market applications, WebAccess supports the DNP 3.0 protocol developed for the power and energy industry. WebAccess also supports standard protocols such as Modbus, OPC DA, and OPC UA, and can be easily integrated with other SCADA software. All of these device drivers are integrated into WebAccess and provided free of charge. For a complete list of WebAccess drivers, refer to webaccess.advantech.com.

Automated Excel Reports

WebAccess provides Excel reports to fulfil demands for self-defined reporting capabilities. Users can build self-defined Excel templates and generate on-demand or daily/weekly/monthly/yearly Microsoft Excel reports automatically. Additionally, the Excel report function is web-based, which means Excel reports can be generated and accessed via a web browser from any location.

Open Data Connectivity

Advantech WebAccess supports OPC UA/DA, DDE, Modbus, and BACnet Server/Client for real-time online data exchanges with third-party software, as well as MS SQL, Oracle, MySQL, and MS Access for offline data sharing.

Real-Time Database

WebAccess Real-Time Database (RTDB) is designed to meet industrial-level demands for high speeds and large quantity data access. The RTDB's fully integrated design means users do not need to learn how to operate this database. Just by enabling RTDB use on the WebAccess configuration page, the WebAccess SCADA node can conduct data processing (simultaneous collection and retrieval) at a rate of millions of records per second. Moreover, the RTDB maintenance feature automatically archives and deletes obsolete data.

Multi-Touch Gesture Support

WebAccess supports multi-touch operation and various pre-set gestures, such as flick to turn page and zoom in/out, as well as two-handed operation. This more intuitive handling style maximizes operating safety, increases usability, and reduces training time. Furthermore, WebAccess also supports the use of multi-point tap/grab/spread gestures to initiate pre-defined actions.

Redundant SCADA, COM Ports, and Devices

Advantech's WebAccess ensures continuous reliable communication to automation equipment. The WebAccess backup node activates when the primary node is down. WebAccess device drivers communicate with backup ports and devices if the primary connection is lost and automatically restore to the primary item when it becomes available.

Smart Factories - Flexible and Accessible Value-Added Manufacturing

Machine automation is the key to increasing efficiency and cost saves in manufacturing. With Industry 3.0, machines were designed to work autonomously. However, with the combination of IoT and Industry 4.0, the aim is to connect machines, work pieces, and systems in a network that allows them to communicate and become an intelligent system, where individual units can influence each other to automatically maximize throughput and quality. In the past, connecting and establishing communication between industrial automation devices and equipment was difficult. IMS research estimates that 85% of legacy devices still lack this ability. The primary reason is the lack of compatibility between equipment produced by different manufacturers. While manufacturers competed to have factories use only their equipment, factory owners faced the challenge of connecting multiple devices together and enabling cross-device communication. This lack of compatible standards and programming languages meant that gathering all data into a single program was extremely difficult and expensive. However, now, because of technological advancements and reduced price points, cross-device communication can finally be realized.

Key elements of innovative smart manufacturing

Connect

All industrial devices are connected in an open network architecture via standard protocols.

Integrate

All machinery data from across the factory is integrated in the cloud and accessible from any location at any time.

Analyze

By integrating information between operation technologies (OT) and information technologies (IT), factory data is transformed into valuable information that enables enterprises to make superior data-driven decisions.

Motion Control Overview

Motion Control Solutions to Satisfy Market Demands

Align with the PC-based control to provide latest processors, flexibility and main stream Ethernet fieldbus, Advantech intelligent motion control product division provides solutions to OEM Machine Makers and System Integrators. The core technologies are based on state-of-art DSP/FPGA/SoC processors, Advantech's own softmotion kernel for trajectory and control, EtherCAT motion bus and configuration utility.

With one Softmotion kernel, users can leverage the new, high performance computing hardware and latest application functions supported in the kernel, it will help machine makers to enhance their machine features and performance.

With the support of EtherCAT open standard protocol, users can leverage the high speed cycle time for high performance synchronous motion control, the Ethernet cable connections to save wiring costs, and users can choose from multiple suppliers for servo motors, Linear motors and IO.

Application-Ready Embedded Motion Control

In any vertical specific application, machine builders and system integrators are looking for application-ready control platforms. The main reasons for this consideration are system integrity and system stability. Compared with plug-in motion controllers plus industrial PCs, the application-ready motion control platform provides a well-integrated system with validation to guarantee stability. Furthermore, the concept of solution selling can bring higher add-on value to system integrators and machine builders.

Motion Control Technology

There are three basic types of motion control system: Point-to-point, Contouring and Synchronization.

Point-to-Point (PTP) Motion

Point-to-point (PTP) movement is the most basic form of motion control. The principle function of the PTP is to position the tool from one point to another within coordinate system. It is used when precise start and stop position is important, but the path is irrelevant. Velocity, time, and acceleration can be defined for point-to-point moves, allowing the controller to construct either a T or an S-curve move profile.

Contouring (Continuous Trajectory)

To achieve contoured motion, a series of points is provided during programming, and the motion controller extrapolates a smooth line or curve from these points. Unlike point-to-point motion, contouring guarantees that the system passes through each point, using either linear or circular interpolation. Between the points, linear or circular interpolation is performed, leading to a contour described by a succession of linear segments. In a contoured move, a time to complete the move is specified, but the actual move profile is determined by the motion controller.

Synchronization

All synchronization controllers follow the Master- Slave principle. Where the Master can freely move with any motion profile under control of any speed curve and one or several Slaves exactly follow the Master motion in terms of position and speed.

The control is based on incremental position feedback by means of encoders on both sides. Many applications just use a measuring wheel with encoder instead of a Master drive. It is possible to preset every speed or gear ratio by means of adjustable impulse scaling factors.

Ethernet-Based Motion Control Solutions

Motion control is growing in complexity as the number of axis in newly developed machines with motion control increases each year. Distance is also becoming an issue, as motors are located further and further away from the host computer.

Distributed Motion Control

EtherCAT

EtherCAT (Ethernet Control Automation Technology) is a high-performance, Ethernet-based fieldbus industrial network system. The protocol is standardized in IEC 61158 and applies to automation applications that need faster and more efficient communications. Short data update times with precise synchronization make EtherCAT suitable for real-time requirements in automation technology.

Functional Principle

In EtherCAT network, the Master sends Ethernet frames through all of the slave nodes. The Standard Ethernet packet or frame is no longer received, interpreted, and copied as process data at every node. Instead, slave devices read the data addressed to them and input data are also inserted in the same time while the telegram passes through the device, processing data "on the fly". Typically the entire network can be addressed with just one frame.

Protocol

Data exchanges are cyclically updated between EtherCAT Masters and Slaves. Data in EtherCAT frames is transported directly within the IEEE 802.3 Ethernet frame using Ethertype 0x88a4 and are processed by the EtherCAT Slave Controller on the fly. Each EtherCAT datagram is a command that consists of a header, data and a working counter. The datagram header indicates what type of access the master device would like to execute:

- Read, write, read-write
- Access to a specified slave device through direct addressing
- Access to multiple slave devices through logical addressing

Logical addressing is used for the cyclical exchange of process data. The header and data are used to specify the operation that the slave must perform, and the working counter is updated by the slave to let the master to know that a slave has processed the command.

Every EtherCAT datagram ends with a 16 Bit Working Counter (WKC). The Working Counter counts the number of devices that were successfully addressed by this EtherCAT datagram. EtherCAT datagrams are processed before receiving the complete frame. In the case that the data is invalid, the frame check sum (FCS) is not valid and the slave will not set data for the local application.

Topology

EtherCAT supports a variety of network topologies, including line, tree, ring and star. The line and tree topologies are more conducive to fieldbus applications because they require fewer connections and utilize a much simpler and more flexible cabling schema that switches and hubs are not necessary for lines or trees topology.

Inexpensive industrial Ethernet cable can be used between two nodes up to 100m apart in 100BASE-TX mode. EtherCAT makes a pure bus or line topology with hundreds of nodes possible without the limitations. Up to 65,535 devices can be connected to EtherCAT, so network expansion is almost unlimited.

EtherCAT supports individual nodes to be connected/disconnected during operation. If one of the slaves in the network is removed, the rest of the network can continue to operate normally. EtherCAT also enables other communication features such as cable redundancy or master redundancy with Hot Standby.

Synchronization

Distributed Clocks (DC) mechanism provides highly precise time synchronization between slaves in an EtherCAT network, which is equivalent to the IEEE 1588 Precision Time Protocol standard. By using distributed clocks, EtherCAT is able to synchronize the time in all local bus devices within a very narrow tolerance range. All EtherCAT slaves are provided with an internal clock which named as System Time (Local Time). One EtherCAT Slave, is used as a Reference Clock and distributes its Clock cyclically.

Possible misalignment between the reference clock and the clocks of the other slaves are caused when a slave is switched on, the internal free-running register that holds the current time is reset to zero. Unfortunately, this action doesn't happen at the same time, and this result in an initial offset (toffset) among clocks has to be compensated.

Typically, masters send a broadcast to all other slaves in the system. Having received the message, slaves will latch the value of their internal clock. There are two latch values, one is receiving and the other is returning back. Thus, the master can read all latched values and calculate the delay for each slave (t_{propagation} Delay). Delays will be stored into offset register. In the following, the master will send a message periodically to all other slaves in EtherCAT network to make the first slave the reference clock and forcing all other slaves to set their internal clock by the calculated offset.

Because synchronization between slaves in DC mode is done by internal clocks in hardware, EtherCAT guarantee the time jitter is less than 1us.

Diagnosis with Exact Localization

EtherCAT is an ultra-fast I/O system. To reach the best high-speed communication, high communication accuracy is demanded. EtherCAT comprises a wide range of system-inherent diagnostic features which help detect and locate system errors precisely.

Every EtherCAT datagram ends with a 16 Bit Working Counter (WKC) to count the number of devices that were successfully addressed by this EtherCAT datagram. The Master can check the data exchange situation by WKC in the same cycle and the error frame can be detected by analyzing the nodes' error counters. The slave application will be executed only as the frame is received correctly.

The automatic evaluation of the associated error counters enables precise localization of critical network sections.

Bit errors during transmission are detected reliably by the analysis of the CRC (Cyclic Redundancy Check) check sum. CRC is an error-detecting code commonly used in digital networks and storage devices to detect accidental changes to raw data.

In addition to the error detection and localization protocol, transmission physics and topology of the EtherCAT system allow an individual quality monitoring of every single transmission path.

AMONet

AMONet makes machine building with motion control easier. The savings made on wiring and programming effort, as well as the compatibility with a wide range of popular motors have already led to many requests for AMONet products.

Structure

AMONet products are also categorized as Master cards or Slave modules. While the Master card is kept in the host PC, the slave modules can be distributed so that they are next to motor drivers on the factory floor.

Communication

The communication speed between the AMONet RS-485 slave modules can be up to 20 Mbps. This makes it possible to scan 2048 I/O points within 1.04 ms (or 1024 I/O points in 0.56 ms). Furthermore, an AMONet RS-485 master will update the I/O status automatically, and map data into local memory. Software running on the host PC can then read the status by simply reading the onboard memory, so no polling of slave modules is necessary.

Flexibility

Each port of a master card can control up to 2048 I/O connections or 256 motion axes, so future extensions are easily implemented. The distance between a master card and its slave modules can be up to 100 meters, and this distance is covered with a cost-effective Cat 5 network cable. In addition to saving wiring costs, debugging and maintenance are also simplified.

Compatibility

Another advantage of AMONet RS-485 is its compatibility with motor drivers from different vendors. Advantech provides specially designed wiring boards for popular motion drivers from vendors such as Panasonic, Mitsubishi, Yaskawa and Delta. This makes configuration easier, as pin-to-pin cables can be used. You can also connect to a manual pulse generator directly to adjust and calibrate the system without having to write programs first.

Motion control and I/O functions with AMONet RS-485 use the same library. This unique feature saves time, as programmers do not need to study both a motion library and an I/O library.

Use Motion Control on All Solutions with SoftMotion Technology

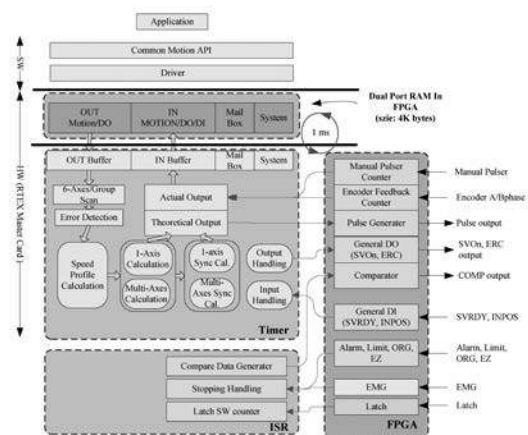

Most machine builders and system integrators face library integration headaches from different vendors and different boards. Moreover, re-programming applications are necessary when the motion control boards are changed or upgraded. Whatever centralized or distributed motion solution, Advantech provides the universal software development environment, which is called Common Motion, for users to develop their motion project by Advantech Softmotion function. The concept of Advantech Common Motion is developed to reduce time-consuming task and give faster time-to-market by the Common Motion library. All Advantech motion controllers are applied to "Common Motion API" architecture.

Programmer can benefit from integrating any Advantech SoftMotion controller without changing the application code in large scale to save the effort of application maintenance and upgrade.

SoftMotion-Based Motion Control

Advantech develops DSP-based SoftMotion control cards which enable the simplified utilization of complex motion manipulation involving JOG, PTP, linear and circular interpolation, multiple axes synchronized motion, and etc. For highly flexible programming features, it has the possibility to offer motion kernel customization. For high performance FPGA, high execution rate DSP, and Dual-Port RAM (DPM) technology, SoftMotion control cards can support faster encoding speeds, higher speed position comparison, and trigger pulse outputs over cards which use ASIC motion IC. SoftMotion controllers can provide programmable acceleration and deceleration to eliminate jerk and smooth velocity profile. For each axis, individual unlimited point tables can realize seamless continuous movements. These tables are also able to combine linear and arc segments. Based on the Common motion API—DSP & FPGA architectures, Advantech provides customers much easier programming environment and robust motion control.

SoftMotion Introduction

SoftMotion Features

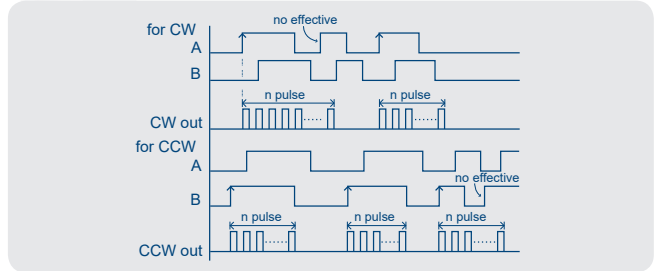

JOG Move

Manually control the axis to directly move within a fixed (predefined) amount of position or continuously in the +/- direction along all axes via external signals; with this feature, users can manually control the movement while reducing CPU loading without consuming system resource.

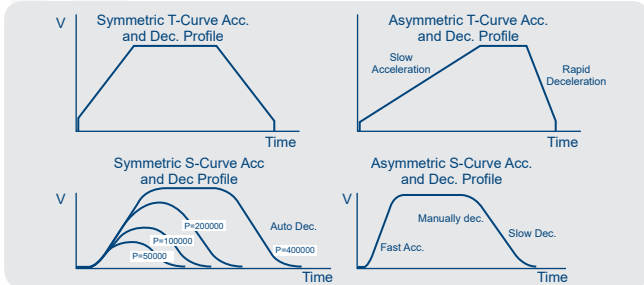

Handwheel Move

Use a handwheel to control a motor to rotate positively or negatively; also, users can define parameters for or use external handwheels to control axial movement.

Trapezoidal and S-Curve Profiles

Users can issue commands to configure movement profiles (initial speed, acceleration, deceleration, maximum speed and acceleration onset rate (or called jerk which is for S—speed-curve movement)) and control a motor to move based on predefined speed curves such as the trapezoidal curve or S-curve (second degree curve).

Programmable Acceleration and Deceleration

Programmable to define the rate of acceleration and deceleration and configure acceleration curve profile (the initial speed, maximum speed, acceleration, deceleration, Jerk) that best meets user needs. Acceleration and deceleration rates can be set independently to ensure the movement better & smooth!

Homing

SoftMotion supports more than 10 homing modes to fit into the mechanical design.

Helical / spiral movement by interpolation defined by

- (1) center position
- (2) terminal point on the circular route or points along the circular route
- (3) terminal point on the circular route and Z axis movement.

To perform interpolation up to 2+1 axes for helical / spiral movement.

Multi-Axis (Group) Motion

- Group settings: up to 3 group settings
- Linear interpolation: up to 8 axes
- Speed override is available

3-Axis Linear Interpolation

Backlash Compensation

In order to enhance ball screw repeatability precision, special algorithms and commands can be adopted to eliminate these errors and offset their inherited weakness in mechanism design.

Superimposed Move

Change the current state of motion by superimposing new commands onto existing movement. E.g. the expected position and speed are 5,000 and 300. The state of motion is changed by superimposing position 1,000 and speed 100.

Tangential Following

The knife control of cutting machine is typical application. For Z axis movement, a motor follows the X-Y movement and curve. As shown below, the tangential direction of the circular movement for the Z axis on this X-Y dimension will be adjusted instantly to ensure that the radius between its movement and the circular trace stays at 90 degrees.

Position Window Output

The digital output voltage level within a certain position window can be controlled by using commands.

SoftMotion Introduction

Position / Velocity Override

Under certain conditions, users can use commands to set up and change the position of a terminal point and movement speed to fulfill certain purposes. The terminal points and movement speed can still be changed on the fly.

Position / Velocity Override

Simultaneously Start/Stop

Simultaneously start/stop can be achieved by issuing commands to configure settings to trigger multiple axes and multiple cards from external signal sources. Software control via commands is also supported.

Trigger Function

- Single compare & trigger: trigger on a single position.
- Table compare & trigger: multi position triggers during fixed intervals or variable intervals can be achieved via commands.
- Linear compare & trigger: triggers on any position within 2D or 3D space can be achieved via commands.
- Compare and toggle trigger: as shown in the bottom right figure, we can set to invert DO after triggers of a certain position – ex. high voltage level at the first point after triggers for DO, low voltage level at the second point after triggers for DO, and high voltage level again at the third position and ends with a low voltage level at the fourth point.

E-Gear

Multi-axial and absolutely synchronized controls can be achieved through SoftMotion algorithms and parameter configurations. With E-Gear, users can enforce configurations and controls over master and slave gears through their relationship. This not only simplifies the mechanism designs, but also saves mechanism space and enforces absolute and synchronized controls.

Entering terminal points of axis with relative and absolute positions, users can configure the motor to arrive at the final position configured. With this feature, users can activate multi-axial control and simultaneous start/stop on the same or different cards.

E-Cam

The relationship of relative movement between master (shaft axis) and slave (follower axis) axes can be established from following tables and it can simulate moves of the cam and provide multiple movement models based on the relationship.

Path Table Motion

- Supports up to 3 describing path tables and each table can be up to 10,000 points
- Supports linear and circular interpolation commands
- Supports start/stop motion list as descriptive commands for movement control
- Supports Pause/ Resume commands
- Supports Auto Blending
- Supports Z axis following movement

SoftMotion Introduction

Look Ahead

By configuring customized parameter profiles (e.g. feed speed and acceleration) users can use the forward looking preprocessing module to enforce movement control and continuous small segmented linear-wise trajectories processing procedures.

Up to 3 Groups of Vectors Moving

With SoftMotion algorithms designed to enhance DSP and FPGA interaction, users can use the system to perform interpolated movement: to simplify the design of machines for mechanism designers.

Event Interrupt

Instantly notify users with event interruption alerts when specified event occur. So, users can activate contingency procedures based on event condition.

Position Latch

Record down the theoretical and actual motor positions when corresponding sensors are triggered.

Gantry Control

Ensure that the error deviation of absolute mutual parallel axes positions during active sessions remain within the predefined range via special algorithms to achieve gantry controls.

Common Motion API Introduction

Architecture and Features of Common Motion API

Advantech's New Generation Motion Control Software

System integrators often encounter difficulties when an engineer may not be familiar with the different syntaxes during the integration of various motion control cards. And what both of them the most is that when the system has to be upgraded, the problems often occur with rewriting the program as well as increasing the development time. To reduce these difficulties, Advantech has introduced a unified interface - Common Motion API- which provides a single syntax and interface, regardless of the types of motion control card the integrator chooses to use. The design can proceed under a single syntax interface to save development time and speed up the time to market. The ACM (Advantech Common Motion) architecture defines a single interface which consists of three types of operation objects, including Device, Axis and Group and each object has its own Property, Method and State.

Features of Common Motion API

- Provides complete debugging tool utility
 - Hardware wiring testing
 - Software functional testing
 - Condition & status monitoring
- Provides the dedicated APIs for different applications
- Simplifies API calls process
- Improves the integration
- Supports scalable hardware
 - Supports the existing hardware and future hardware development

Through the above advantages and the lower learning threshold, integrators can significantly reduce development time and follow-up maintenance work!

Introduction

The PCI-1245L/45LIO are 4-axis universal PCI cards (supporting both 3.3 V and 5 V signal slots) stepping/pulse-type servo motor control card designed for entry-level applications which need to control JOG, point to point, continuous move and interpolation motion such as 2-axis linear, 3-axis linear (PCI-1245LIO) and 2-axis arc move (PCI-1245LIO). The PCI-1245LIO also provide extra 16 DI and 16 DO via terminal board, MTB-3956LIO.

In addition, all Advantech motion controllers use the "Common Motion API" architecture which is a unified user programming interface and graphical utility. This architecture saves application maintenance and upgrades. Programmers can benefit from integrating any Advantech SoftMotion controller without changing large amounts of the application code. User-friendly examples decrease programming load, helping users complete configuration and diagnosis easily.

- Diagnostics for fast error handling can trace command and error message

Introduction

The PCI-1203 is a 2-port EtherCAT PCI Universal card. It is a ready-to-use EtherCAT development platform for all PC-based industrial automation. The EtherCAT protocol stack is executed autonomously on the PCI card.

It allows the host to handle up to two EtherCAT networks with extremely short cycle time for Motion and pure I/O applications. For EtherCAT motion port, communication cycle time is no more than 500 μ s for connecting 32 axes of servo motors and for fast I/O ports the cycle time is no more than 200us in a high speed I/O system. There are 4 - channel isolated digital outputs and 8 - channel isolated inputs on the PCI-1203 to meet the extra high speed I/O requirements. Real-time and high-precision capability are features of PCI-1203. In addition, all Advantech motion controllers use the "Common Motion API" architecture which is a unified user programming interface and graphical utility. This architecture saves application maintenance and upgrades. Programmers can benefit from using any Advantech SoftMotion controller without changing large amounts of the application code. User-friendly examples decrease programming load, helping users complete configuration and diagnosis easily.

Machine Vision Introduction

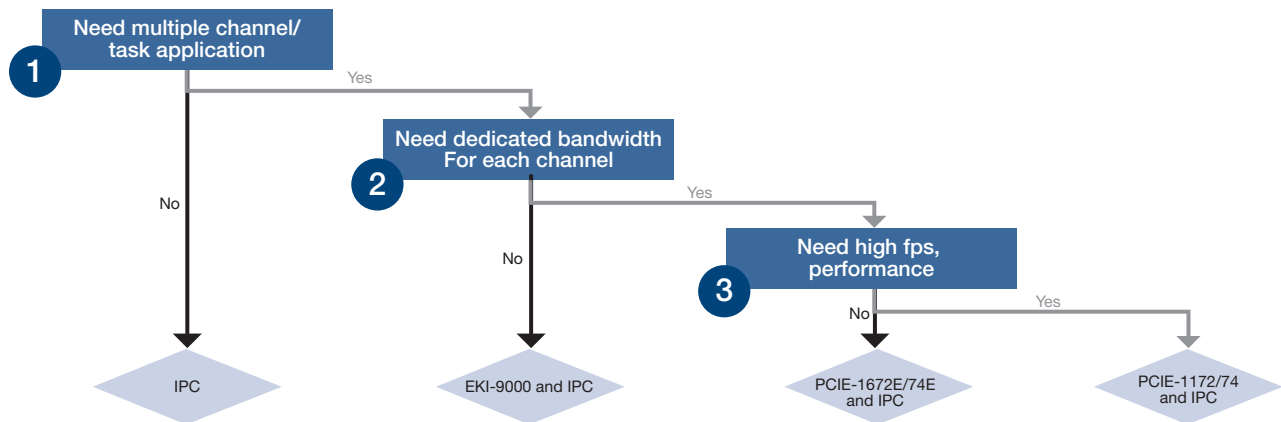

Introduction

Machine vision is used in every manufacturing market, from food beverage, pharmaceuticals, automotive, semiconductor to general manufacturing, the human eye inspection and response is too slow and unreliable for the demanding manufacturing process nowadays, replacing human inspection with machine vision can go further in the automating factory operation, the majors applications are quality assurance, production automation and identification

The era of Industry 4.0 is upon us, the scope of the factory will change dramatically, not only the ability to produce, but to produce with the most flexibility and efficiency, machine vision plays an important role in achieving 100% quality control in manufacturing, reducing costs, increase flexibility and ensuring a high level of customer satisfaction to fit the demands of smart manufacturing.

The move from analog to digital is prevalent, and the GigE Vision become the most significant interface in this market, Advantech provides high performance GigE Vision solutions, an open PC-based architecture, including industrial camera, computing platform, frame grabber for the traceability, alignment, gauge, identification and inspection application to fulfill the requirements for versatile machine vision applications.

Selection Guide

Application Stories

Backend semiconductor packaging inspection machines

The semiconductor industry has some of the most demanding applications, requiring a combination of extreme accuracy and precision combined with high throughput. Keeping up with innovations in packaging, the challenges to achieve this drastically increase. The fast-paced progress towards greater densities and finer dimensions are pushing the limits of vision systems.

Advantech suggested an intelligent GigE Vision frame grabber, DSP-based multi-axis motion control card and compact modularized system for direct integration in space-constrained machine to accomplish high-precision, high productivity IC packaging inspection. The solution adopts an industrial grade computer to combine PCIE-1174, four-channel intelligent GigE Vision frame grabber with include a dedicated FPGA (Field Programmable Gate Array) to reconstruct images before transmitting them in real time to the host PC via DMA (Direct Memory Access). This then frees up the host PC's processor and ensures there is no frame or packet loss during image acquisition.

Improve fabric quality in textile industry

Textile manufacturing is a very complex process. Weaving is the most basic process which involves interlacing a set of vertical threads (called the warp) with a set of horizontal threads (called the weft).

The new optical web inspection system can detect the warp thread break less one second and ease of use and maintenance. Accordingly, Advantech suggested the UNO-3283G, an Intel i7 Fanless Automation Computer with 2 x GbE, 2 x mPCIe, HDMI, DVI-I, and PCIE-1172, two channel intelligent GigE Vision frame grabber with include a dedicated FPGA (Field Programmable Gate Array) to reconstruct images before transmitting them in real time to the host PC via DMA (Direct Memory Access). This then frees up the host PC's processor and ensures there is no frame or packet loss during image acquisition. To further aid installation and maintenance, this series also includes the use of PoE (Power over Ethernet) and Ad Hoc protocol which, like DHCP, doesn't require a specific IP address and enables System Integrators (SI) to simply plug the camera in and go.

Implement the product traceability in food & beverage

As the market demand for food safety increases, traceability is getting more attention in the food and beverage industry as well as the packaging industry. One of the world's leading providers of beverage containers would like to identify the bar codes, characters and numbers on the ink-jet printing labels at a 7 unit per second run rate. Advantech provided the multiple camera, PC-based automated optical identification system to identify the bar code, data code, and the character on the beverage container, the system consists of AIIS-1240, 4-CH PoE compact vision system with Intel® Core™ i7 CPU; Inspector Express, a graphical user interface machine vision application software specifically designed to simplify the design and deployment of automated inspection on the factory floor; QCAM-GM0640-120CE, 0.3 Megapixel industrial camera, features with the PoE (Power over Ethernet) to simplify installation and maintenance.

Vision system and robotics ensure finished product quality in automotive industry

In the automotive industry, quality control is an extremely important part. Most of time, there are engineers to verify the interiors and exteriors, including dash board, door, seat, light, and color for the finished product quality check. In one of the largest automotive groups, there are about 100 items in the finished product check list and the client was looking for a quality check system to perform the inspection automatically. To automate the quality check of the parts in different vehicles, a flexible and extensible system had to be created, and due to numbers of characteristic, the system integrators designed the AOI (Automated Optics Inspection) system with multiple-camera and robots for high flexibility and efficiency. To satisfy this case, Advantech suggested PCIE-1674E, four channel GigE Vision frame grabber and QCAM-GM2500-014CE, 5.0 Megapixel industrial camera including PoE (Power over Ethernet) function, to simply the installation and maintenance. Besides these, there are other products to help provide the client with the desired functionality. The UNO-3283G, an Intel i7 Fanless Automation Computer with 2 x GbE, 2 x mPCIe, HDMI, DVI-I, and the PC-1756, a 64-ch Isolated Digital I/O PCI Card for digital signal path to provide the total solutions in this case.

Introduction

The PCIE-1172/1174 series is a PCI Express® dual/quad channel frame grabber for two/four independent GigE Vision cameras. They feature GoE (GigE Vision Offload Engine), PoE (Power over Ethernet) and ToE (Trigger over Ethernet) for high performance, robust and reliable machine vision applications. Unlike conventional NICs (network interface controller) GigE Vision protocol is implemented in software and executed on the host CPU, the processor must spend more resource to handle the network traffic and incoming frames rather than the machine vision algorithms, especially in high bandwidth, multiple camera applications. The GoE feature significantly off-loads the GigE Vision protocols into dedicated FPGA (Field Programmable Gate Array), reconstruct the image then transmit to the Host PC via DMA (Direct Memory Access) in real time, release the host processor resource to execute algorithm and applications and there is no frame or packet loss during the image acquisition. The comprehensive ToE/PoE features can lower the installation/maintenance effort through the single cable connection, and reduce image acquisition latency, with the Ad hoc network feature, the connection between GigE Vision cameras and frame grabber are self-configuring, the user define IP address is no longer necessary, and significantly reduces the installation and maintenance cost and effort.

Power and Energy Automation Overview

Introduction

The successful management of power & energy applications is becoming increasingly critical as new energy sources, distributed across a much wider area than fossil fuels, become increasingly important. The informatization, intellectualization and energy development of these new energy sources will change the traditional model, from a single communication model without response, to an alarm-to-intercommunication, and unified communication model.

Advantech, as a leading manufacturer of industrial PCs for power and energy applications, provides intelligent components, from smart meters, IEC-61850-3 certified industrial computers, intelligent wireless gateway to SCADA software, focusing on renewable energy generation, substation automation system development and energy management.

Through a host of innovative products and solutions, Advantech has shown itself to be one of the key enablers of Industrial IoT and Industry 4.0.

Smart Substation Automation

Applications for station level, bay level and process level

▪ SCADA Application

In Smart Substations, it's essential to be able to remotely monitor substation devices from a central management center. To achieve this, high performance computing platforms integrate HMI/DATA collection, data monitoring, environmental status, which help operators accurately evaluate their devices' status and take action.

- Application Requirements
 - Reliable IEC 61850-3 certification
 - High-performance computing platform
 - AMT/TPM

▪ Cyber Security for Smart Grids

There are different grades of network protection priorities in a substation, and use in these environments needs reliable cyber security. This requires a software firewall or comparable hardware firewall devices to prevent illegal and unauthorized user access.

- Application Requirements
 - Reliable IEC 61850-3 certification
 - High-performance Ethernet
 - Virtual Machine/TPM

▪ Communication & Data Gateway with IEC 61850

Within a substation, various devices use a wide variety of protocols, such as IEC-60870-101/103/104, Modbus or other private rules. The status and information of these devices needs to be accurately monitored and collected through a gateway computer with a unified communication transition protocol. It's very important that transfer devices use various protocols to unify the IEC-61850 protocol.

- Application Requirements
 - Reliable IEC 61850-3 certification
 - Multiple communication interfaces support
 - Isolated serial ports, Ethernet ports, IIRIG-B

▪ Auxiliary Safety Monitoring

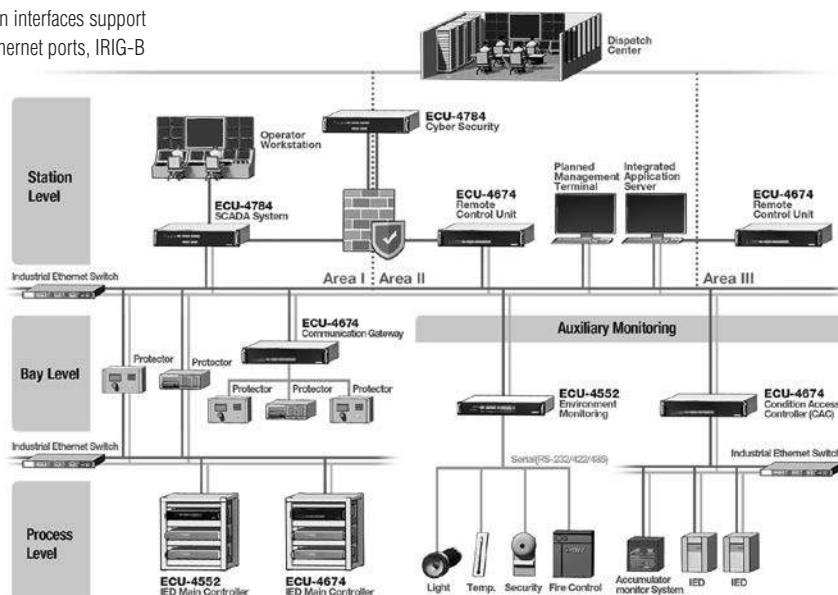

Along with modern computing and network communication technology, fast developing, electricity system automation becomes more important, especially for safety precaution related applications. The goal is to avoid the issues of traditional substation "isolated island", such as non-precaution and non-linkage conditions. Advantech's computers and devices provide safety related information acquisition and monitoring, such as environmental parameters, facility parameters, access guard status and other unusual conditions.

- Application Requirements
 - On-board or expansion IO for data acquisition
 - Communication protocol support for monitoring sensors

▪ Primary Device Monitoring

In smart substations, traditional primary devices including transformers, GIS, CT/VT, Thunder and other isolated switches, normally operate without precaution, monitoring or unified communication protocols. Along with the development of modern smart substations, the IEC-61850 standard is latest trend in substation applications and primary device monitoring. To meet these requirements, Advantech provides IEC-61850 compliant computer platforms for data communication and transmission which keeps primary devices operating normally.

- Application Requirements
 - Flexible I/O, communication interfaces and protocol support
 - Highly reliable computing platform

Renewable Energy-Solar Monitoring solution

With the increasing construction of solar power plants, customers are finding it difficult to handle issues of the number of communication protocol requests, unstable communication networks on distributed farms and no high-efficiency or intelligent monitoring software. This means traditional solar power monitoring solutions can not satisfy modern fast developing solar operation requirements.

To solve customers' issues, Advantech provides high-performance computing platforms, total data acquisition modules, communication protocol gateways, network communication and cloud software solutions with multiple communication protocols and stable Ethernet or wireless network support, network switchboards and remote monitoring software.

■ Data Acquisition Using Multiple Communication Protocols

There are many types of electrical equipment in solar power farms, such as inverters, combiner boxes, intelligent or non-intelligent power meters, which need the support of a diverse range of communication protocols. For device data acquisition Advantech provides communication platforms compatible with these protocols.

- Application Requirements
 - X86/ RISC-based gateway platforms
 - Multiple serial ports / network ports
 - IEC-60870 / Modbus / DNP3 protocol support

■ Wireless Communication on Distributed Solar Power

Distributed solar power farms are scattered over vast and remote areas, and establishing a stable communication network system under this applications is not easy. To reduce wiring costs and maintain a stable communication network, Advantech provides gateways capable of supporting 2G/3G/Wi-Fi/4G wireless for selection and keeping communication networks stable and with data integrity.

- Application Requirements
 - 2G/3G/Wi-Fi/4G wireless
 - Reliable platform with integrated intelligent software

■ Remote Monitoring and Maintenance

The operating status of solar power plants (especially solar panels) directly affects power generation efficiency and capacity. Comprehensive centralized monitoring and scientific management is important. Due to the characteristics of wide areas and long distances, Advantech provides remote control solutions for helping administrators immediately understand the operational status of the plant through handheld devices or PCs. This helps with the timely control and maintenance of equipment while enhancing the efficiency and safety of solar power plants.

Power Energy Management

In order to reduce production costs and increase product profitability, manufacturing factories require the integrated monitoring management and optimization measures to manage their high energy-consuming facilities. Advantech not only provides the practical and easy-to-implement energy management solutions, but also has a full range of portfolios, including the front-end products (smart meter, data acquisition module and control host) and back-end management platform to offer the complete solutions for enterprises to achieve energy efficiency.

■ Multifunction Smart Meter

WISE-M500 series products are multifunctional smart meters and are in line with European standard design with easy to install and configure to meet the energy monitoring requirements of industrial equipments at minimum investment costs as well as obtaining maximum economic benefits.

■ High Energy-consuming Equipment Monitoring Application

Since harmonic can have a significant impact on electrical distribution systems and the critical facilities they feed, Advantech's energy-consuming management solutions use the equipment failure diagnosis and prevention mechanism to provide analytical information through monitoring the harmonic currents generated by non-linear electronic loads, so as to improve production efficiency and reduce maintenance and energy costs.

■ Factory Facility Monitoring Application

By providing real-time energy consumption data to accurately grasp the key moments, Advantech's factory facility monitoring system aimed at controlling the high consumption facilities such as lighting, HVAC (heating, ventilation and air conditioning) and UPS (uninterruptible power supply). Meanwhile, we offer the time-of-use pricing service to adjust the use and operation of the facility according to the actual power usage and electricity tariff, thus saving energy costs.

■ WebAccess Based Remote Energy Management Solution

For the factory's energy consumption, Advantech WebAccess SCADA software is able to implement the remote management, energy consumption status overview, energy saving potential assessment and recommend practical measures, energy monitoring and reporting analysis, etc. to effectively achieve energy savings and cost control.

1 PCIe, DP/VGA, 8 DI/O

NEW

Introduction

The UNO-1483G is an Intel 4th generation Core i3 DIN-rail controller. This controller features dual power inputs that shorten down time and enhance operation excellence. The general purpose input/output ports also help machine builders integrate direct control of start/stop inspections and indicate inspection results. UNO-1483G is also equipped with PCIe slot and Advantech iDoor technology that extend this product to applications such as motion controller, or isolation control unit using iDoor modules. A UNO-1483G fitted with 4 gigabyte LAN, 2 USB 3.0, 3 COM, DP, and VGA provides essential upstream and downstream links. PoE, for example, can be connected to an IP camera using iDoor.

Configurable Panel PC Introduction

Panel PCs suffer from one major drawback: lack of flexibility in their configuration. When you buy a PPC you are limited to the options that the manufacturer chooses. Now, in an industry first, Advantech has solved this problem by allowing System Integrators to choose any Mini-ITX motherboard (MB) and have it installed by Advantech's own engineers.

3 Steps to configure your system!

Choose Standard Mini-ITX MB

- According to functionality

Select Chassis

- Correspondent chassis
- Cooler

System configure

- CPU
- Memory
- Storage

Assemble in CTOS!

More flexible choice of Standard Mini-ITX MB!

The configurable Panel PC works with any commercially available Mini-ITX motherboard. The issue with traditional panel PCs is that the display panel and the touch sensors are proprietary, and connecting them to a third-party MB is a near impossible task. Advantech has solved this problem by developing a proprietary daughter board which translates the signals of the display panel and sends them to the MB.

Off-the-shelf replacements save time and money!

In addition to the flexibility in choice of motherboard, which allows users to choose boards which meet their exact requirements, rather than having to over spend on redundant features, the flexibility means that, in the event of a motherboard failure, an off the shelf replacement can be purchased and installed in a quicker fashion than having to send the machine away to the original manufacturer.

Certified and Installed MB within 30 days!

In addition to providing a list of pre-certified motherboards, which can be installed in just 7 days, Advantech can also take any other off-the-shelf motherboard and have it certified and installed within 30 days. This means the PPC is the most flexible panel PC on the market and demonstrates Advantech's commitment to being the most forward thinking industrial automation company.

Control IPC Overview

Introduction

Advantech offers PAC solutions designed for industrial automation applications that combine the openness and flexibility of PCs with the reliability of traditional automation controllers, such as PLCs. Advantech's offerings include the APAX series, ADAM-5000 series, utilizing sophisticated thermal designs to ensure the system stability. APAX series support Windows CE, Windows 7/10 and Linux operating systems. Advantech's Control IPCs are ideal platforms to implement in diverse applications, such as power/energy, transportation, machine automation, factory automation, building automation, facility management system, environment monitoring, and more.

Real-time Control IPC: APAX Series

APAX series are Ethernet-enabled controllers allowing users to deploy I/O modules in flexible expansion combinations, like direct stack or daisy-chain. The control performance and functionality are not only better than PLCs, but also better than most PC-based controllers. Features including versatile CPU modules, I/O modules designed as reliable as PLC I/Os, high density I/Os with LEDs, hot swap and stackable functionality are delivered. Both C/C++ and .NET library, and IEC 61131-3 languages are provided as programming tools.

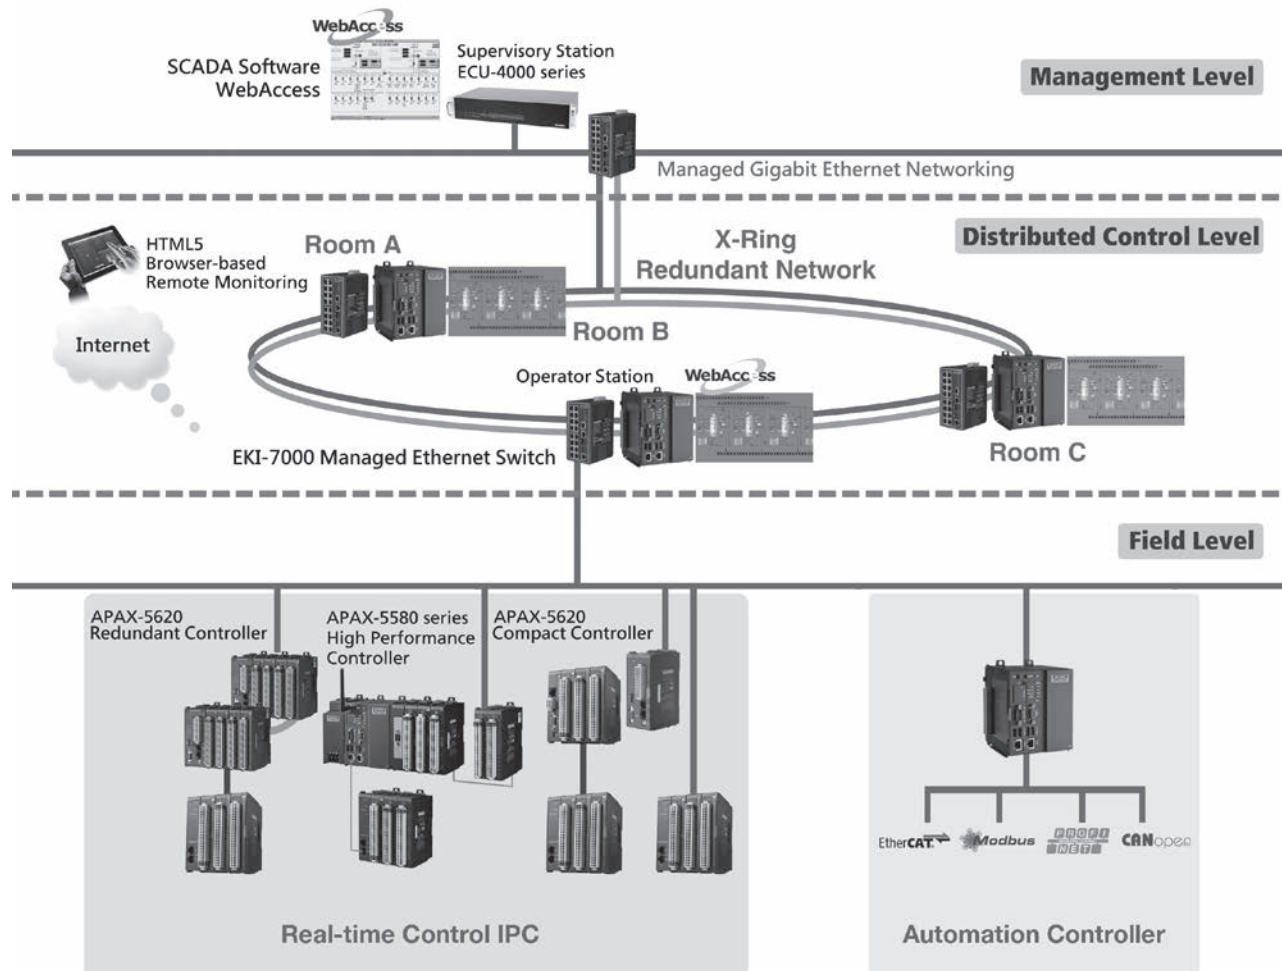

Data Acquisition Control IPC: ADAM-5000 Series

ADAM-5000 series are modularized I/Os to be inserted on backplanes with fixed slot numbers. Leveraging Advantech's rich experience in industrial data acquisition applications, ADAM-5000 offers a compact control system. Inheriting the reliability and robustness of a PLC system, ADAM-5000 offers the openness and flexibility of a PC, including computing power, networking and storage capability. Both C/C++ and .NET libraries and IEC 61131-3 languages are provided as programming tools.

Automation Controllers

Advantech's Embedded Automation Computers are designed to fulfill the needs of mission critical automation applications. Their embedded design, industrial automation features and advanced computer technology deliver robustness, reliability and flexibility to satisfy customers who are looking for a rugged and compact computing platform. They support various interfaces to integrate with other devices, such as Ethernet, RS-232/422/485, onboard I/O, extension PC card slots, CAN-bus and more. Through standard Ethernet networking, these computers can link to Advantech remote I/O solutions, such as APAX-5000 high density I/O (through APAX-5070 Modbus/TCP coupler module) or ADAM-6000 series compact modules, to get data and perform control tasks.

Control System Architecture

Control IPC Overview

Real-time I/O Control Suitable for Multiple Domain Applications

Currently most PC-based controllers face one major challenge, especially Control IPCs systems, and that is real-time I/O control. Performance is severely hampered when I/O points increase because the access time also increases, which impacts control precision as well.

Food and beverage companies face shorter production runs on a wide range of products for different vendors, while automotive companies are dealing with changes in customer preference, aggressive competition and rising fuel costs. These industries require a mix of discrete, batch, process and motion control solutions. In the past, these applications forced engineers to use multiple controllers: a PLC for discrete control, a motion controller for multi-axis control, and a distributed control system or loop controller for process applications, which has proven time consuming and costly. Advantech Control IPCs feature the ability to handle all these tasks with a single control system.

The result is shortened development time through reusable programming tools, lower maintenance costs through reduced parts, better information sharing among applications, and fewer support personnel throughout the plant.

Information Processing and Networking Capabilities

Advantech Control IPCs not only provide excellent real-time I/O control, but also another key benefit for automation applications, information processing. With the ability to perform field operations, data exchanges and valuable information collection, this series is able to execute efficient decision-making. Information processing includes data logging and analysis with storage devices like SD or CF cards, recipe management for batch control, and database exchanges through SQL and OPC. Furthermore, implementing HMI software enables local operation.

This improves control system networking tremendously, allowing the network to share a common protocol at the device level, control level, and information level. It provides the ability to move information from the device level to executives at the enterprise resource planning (ERP) level without new protocols or drivers.

Advantech Control IPCs feature a PC-based architecture, delivering significant networking benefits for manufacturers by USB, RS-232, RS-422/485 and Ethernet interfaces. Users can connect to field devices through serial or USB interface to satisfy any kind of application. The Ethernet interface allows users to effectively manage I/O control and information flow throughout the manufacturing and IT enterprise. Leveraging the high computing power of Advantech Control IPCs also allows networks to communicate seamlessly on the factory floor with other common sets of IT capabilities like video, data and telephones. Easy access to such information is critical to making decisions about the capacity of an enterprise.

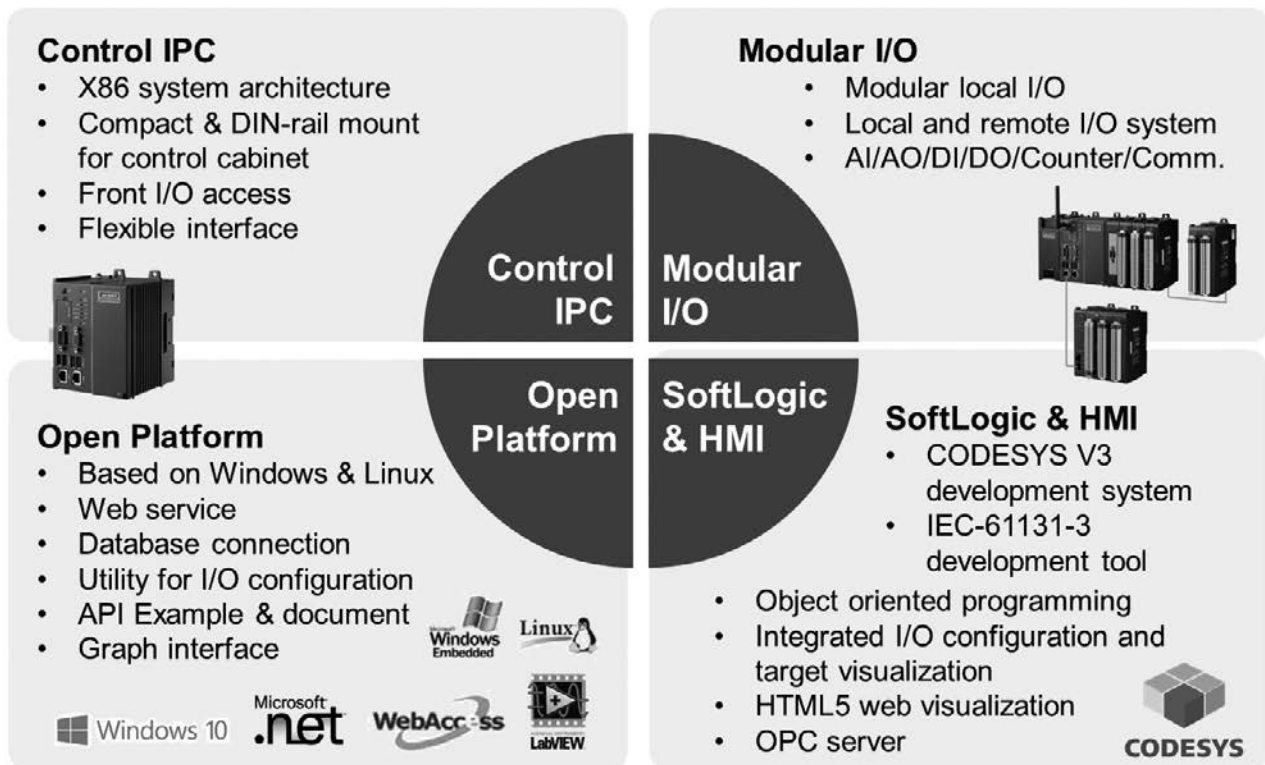

Scalability

In the past, many PLCs required users to learn different programming software and specify networks depending on the size and complexity of the application. Advantech Control IPCs allow users to more closely match the controller to application needs without compromising functionality or learning a new control system. Such scalability reduces the headaches and high costs associated with system redesign, lack of program re-use, and re-training.

Software

Advantech Control IPCs support software to satisfy both PC-based and PLC-based programmers. Leveraging IEC 61131-3 SoftLogic programming environment, PLC programmers can take PLC operations to the next level in many areas, such as communication, information processing, enterprise level database integration, and user interface development.

For PC-based programmers, Advantech offers an open platform solution, with C/C++ and .NET libraries for I/O control and communication functionality. They can satisfy programmers familiar with high level programming languages like Microsoft Visual Studio .NET. In addition, several convenient utilities are offered to save development time.

SoftLogic Control Software

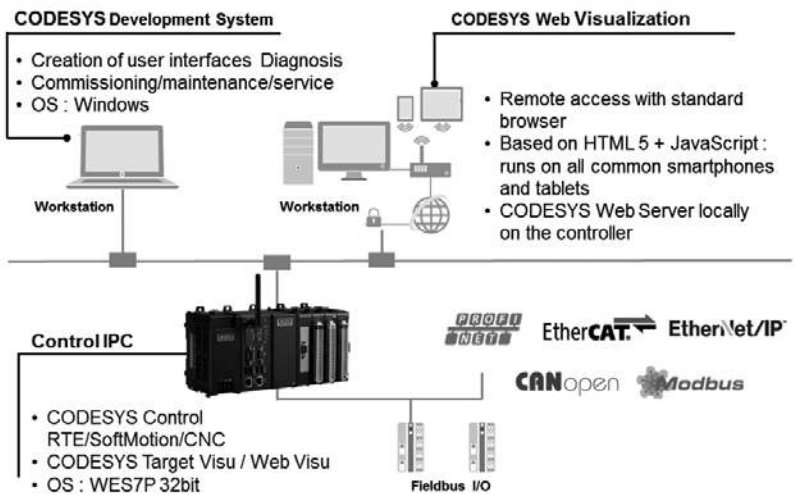

Advantech CODESYS Introduction

For traditional PLC controllers, the development environment will vary depending on the PLC supplier and they are not compatible with each other. Our control IPC adopts the international standard IEC 61131-3 based on PLCopen, established to standardize multiple languages, sets of instructions and different concepts existing in the field of automation systems. Therefore, these programming languages which comply with the IEC 61131-3 standard, usually called SoftLogic software, enable users to leverage PLC-world typical programming interfaces. But they can also benefit from a portability of all platforms and shorten the learning curve from that of the traditional PLC.

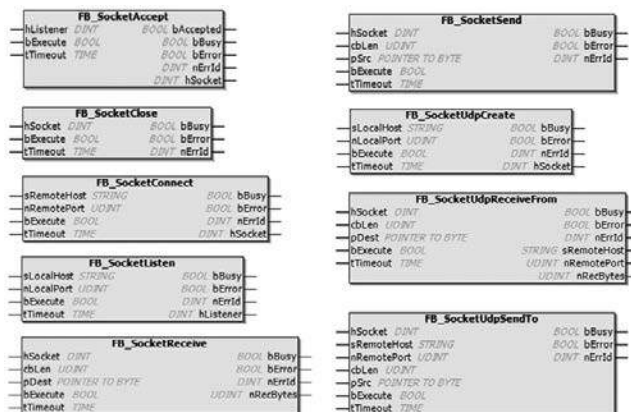

Advantech CODESYS Architecture

Advantech supports all kinds of CODESYS runtime, including RTE, SoftMotion and CNC which based on Windows embedded 7 operation system. Its runtime doesn't only support SoftLogic control, but also visualization, which includes Target(Local HMI) and Web(Browser-based). CODESYS help to make Advantech control IPC has real-time logic control and HMI within one control platform.

Advantech Function Blocks

For communication with higher-level systems and the IT world, Advantech CODESYS provides our own function block to help customer has the way to connect to other Ethernet based devices with specific protocol or database, likes SQL server. we will continue implement more and more based on PLCopen to fulfill IIoT application.

PC-based Programming Software

PC-based Programming Software

Advantech Control IPCs offer the seamless software integration for automation applications. Regarded as SoftPLC, Advantech Control IPCs not only leverage PLCopen, IEC 61131-3 software including LD/FBD/IL/ST and SFC, but also empower many application-oriented & practice-oriented function blocks to different domain fields, such as batch control for food/beverage, auto-tuning PID for temperature control in EFMS, PLCopen-compliant motion control blocks for a variety of trajectory control and positioning purposes in machine automation. Multi-tasking, runtime error reports and operating mode changes are also possible for Control IPCs applications.

For PC-based users, Advantech also offers the .NET function library. System integrators can benefit from flexibility to integrate I/O control, motion control, industrial communication protocols and data process/exchange, database access, HMI interface and SCADA. Plenty of C/C++ and .NET examples save programmer learning time, helping save programmers' development effort and shorten time to market.

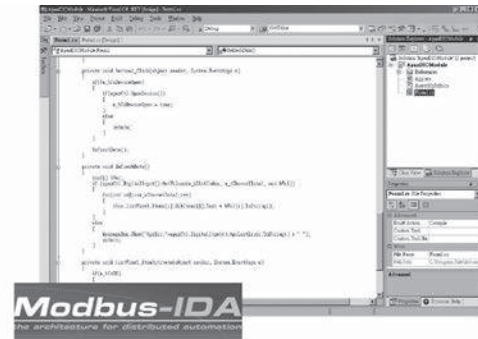

.NET and C/C++ Library

Advantech's Control IPCs series solution offers a complete PC-based platform with Application Programming Interface (API). With C/C++ libraries and .NET class libraries provided by Advantech, PC-based programmers can develop their own programs for industrial control and automation tasks, involving I/O control, system backup function, communication, SQL and scheduling, even integrated with HMI/SCADA interface.

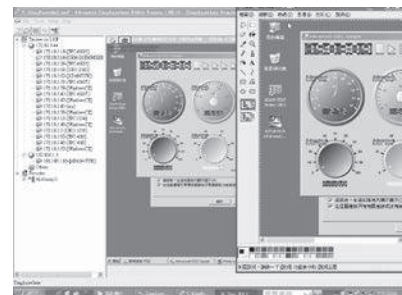

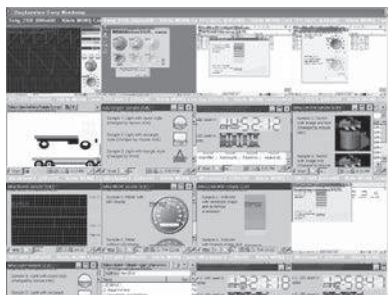

Modbus Server

Advantech's PAC series offers Modbus/RTU and Modbus/TCP for data exchange purposes. Advantech offers a series of APIs, including Modbus server/client configuration, easy data access function and callback function for multithread event handling. Plenty of samples programs can help you to easily set up the Modbus communication. Besides, APAX-5580 series and APAX-5620 controller has built-in Modbus server, so any Modbus client (such as HMI) can access to APAX I/O without writing programming.

DiagAnywhere – Remote Maintenance Software

DiagAnywhere, an abbreviation of "Diagnostic Anywhere", is a networking solution for remotely monitoring and controlling APAX controllers through Windows-based operating systems. It includes the utility on the client side and the server on APAX controllers. Any computer installed with the utility can connect to APAX controllers, seeing what's happens on the controller and performing remote control. It is very convenient that the engineer doesn't need use a screen to operate the controller in the field, and allows them to maintain the system on the remote site. One DiagAnywhere client can monitor and control up to 16 target controllers simultaneously. This useful software tool also supports remote screen snapshots, remote screen recording, file upload and download between utility (on the client computer) and server (APAX controller), favorite devices grouping to manage system more easily, and authentication functionality. All these features help users save maintenance cost and effort.

APAX System Architecture

Introduction

Advantech's Control IPC is a powerful control platform for IoT and other industrial automation applications. Its computing power and different types of standard high speed communication interface make big data processing and decentralized architecture possible. Users can easily add their own vertical application software with the Control IPC and implement the system in automation field sites. To simplify the system configuration, APAX-5000 series provides an easy and flexible way to setup different functions and configurations. There are multiple APAX series system combinations that can be selected to develop reliable control systems as detailed below.

Application Ready High Performance Control IPCs

Advantech's APAX-5580 series and APAX-5620 control IPCs benefit from the high throughput, openness, flexibility and connectivity brought by PC-based architectures. Contributed by excellent heat dissipation technology with no hard disks, they deliver great system reliability. Various peripheral interfaces such as LAN, USB, DVI, audio, RS-232, RS-422/485, etc., are provided. These high performance Control IPCs are suitable for many complex control applications. Besides, its powerful integration ability makes it an ideal platform to integrate video, audio, HMI/SCADA software, database, data processing into one single solution.

APAX-5580 Architecture

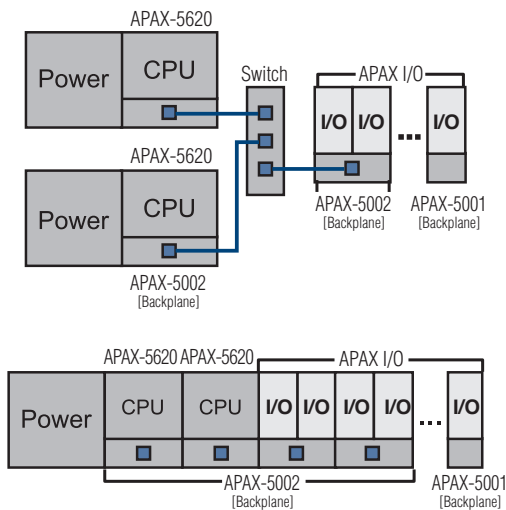

APAX-5620 Architecture

Redundant System

With the data synchronization, the secondary controller can take over the control tasks at the same position which primary fails within a very short time. Depending on customers request, the power supply can be separated to increase the availability.

Reliable Backup System

APAX-5000 series delivers system backup functionality to significantly decrease the risk that the system will fail when the controller crashes. To leverage this, two controllers with the same control program are installed in one system. After both controllers' backup functions are enabled, APAX-5000 will automatically delegate one controller as the master controller. The master controller will run the control program to execute the control process, while another controller (the backup controller) is put on standby. The master controller periodically sends live messages to the backup controller. If the backup controller does not receive a message from the master controller, it will automatically become the master controller and restart the control process. If the master controller is switched, it means there was an error happening on the previous master controller. Therefore, engineers can repair or change the previous master controller and re-enable it as the backup controller. Then if the new master controller fails, the new backup controller will automatically take over the control once again. This mechanism ensures the control system will continuously run the control process.

Remote I/O Scalable System

For different fieldbus or real-time Ethernet networks, such as Modbus/TCP, Ethernet/IP, PROFINET, etc., APAX series offers different kinds of couplers for communication. Controllers, HMI, and computers in the same network can access APAX I/O modules through the coupler. Not having to change I/O modules for different fieldbus or real-time Ethernet networks helps ensuring current I/O modules' investment for future demands. These couplers feature daisy-chain design, making installation easier.

iRTU Overview

Introduction

ADAM-3600 series is a new ADAM series for RTU applications that leverages IoT technology. They feature high environmental adaptability so they can work in remote locations and their new form factor is suitable for installation in control cabinets. Their domain focused on-board I/O design and 4-slot I/O expansion capability provides maximum flexibility to serve a multitude of applications with fewer IO requirements.

Vertical Driven Product Development

The ADAM-3600 series are intelligent RTU terminal units for many types of application fields. Their primary purpose is to execute programmed tasks locally and report back to the datacenter in the cloud.

To fit every conceivable vertical application, the unit needs to have certain vertical features such as domain protocols and algorithms. It must also be a trusted embedded platform which can protect customer's domain intelligence. Developers can use familiar programming languages such as C+ or the 5 main PLC languages defined by IEC-61131-3.

The ADAM-3600-C2G is designed for the oil & gas and water markets and focuses on monitoring, gathering and transmission of data over a wide area. It's equipped with an on-board IO which fulfills most application scenarios in the field. The modularized expansion IO and communication module provide users with maximum flexibility to adapt to field applications. It can also easily integrate with Advantech WebAccess SCADA software and provide users with a complete solution.

The ADAM-3600-A1F focuses on realizing a Smart City vision by leveraging IoT technology. Through it, users can access data directly from the cloud using standard IT languages. To secure user data, it can log all data in the SD/USB storage. It also provides a friendly interface for users to monitor, maintain and upgrade the device.

ADAM-3600's development team will continue cultivating vertical markets, and provide new models and firmware upgrades to service more requirements for IoT applications. Due to the flexible open system architecture, we can rapidly fulfill any customization requirements.

Advantech TagLink, Core Technology for Big-data Application in IoT Era

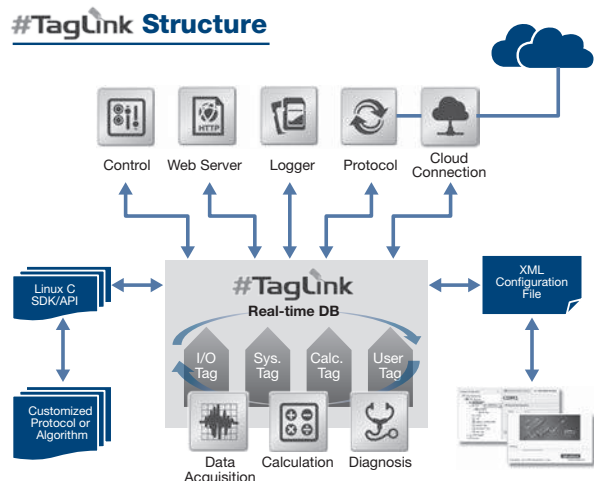

Advantech TagLink is a new technology used with ADAM-3600 series products. It is a technology which helps users access data easily and intuitively as a tag. In the IoT era, data is the primary concern of customers. But for traditional RTU devices, users need to take care of the IO source, scaling, unit translation and communication with other software. With TagLink, users can access the data directly on ADAM-3600 via the tag name. By setting up the "tags", users can then retrieve the physical unit which is well scaled in ADAM-3600. To achieve this, we provide a configuration utility for users to easily map the I/O data.

In an on-site application, one or several RTU devices may have been installed. We provide tool to carry out the configuration and management of these RTU devices as well as the whole project in a unified and user-friendly way so more of your resources can be freed. TagLink Studio helps you configure and manage devices and projects which may have multiple devices under it. Moreover, Advantech TagLink supports various standard protocols such as: Modbus, DNP3 and IEC-104, which can realize multiple communications between RTU and devices or meters.

As an Industrial IoT core technology, Advantech TagLink provides a solution which centralizes data access and activates connectivity, diagnosis and web services altogether within the software. Advantech TagLink enables local data to be exchanged between independent devices and applications. Mass data can be filtered out which saves IT maintenance cost and time. When Advantech TagLink is deployed with Advantech WebAccess, active connection and breakpoint resume services could be provided to ensure the reliability of data transmissions. Advantech TagLink provides an open interface for customized protocols or algorithms and with standard Linux C language, it also provides logic control based on IEC-61131 to complete local data pretreatment.

Introduction

ADAM-3600-C2G is an intelligent Remote Terminal Unit with multiple wireless function capability, multiple I/O selection, wide temperature range and supports flexible communication protocol for oil, gas and water applications. In these application environments, ADAM-3600 is ideal for remote inhospitable regions with many devices that need to be managed remotely.

Features

Wide Array of Flexible I/Os

Wide array of on-board I/O and flexible expansion I/O modules supporting different acquisition requirements giving it a high cost performance.

Wireless Communication & Protocols

The ADAM-3600 simultaneously supports two mini-PCIe cards (a half-size and a full-size) for Wi-Fi/ 3G/ GPRS/ Zigbee communication which is flexible for wiring in the field. Modbus RTU/TCP and DNP3 protocols integrate ADAM-3600 with more SCADA systems.

Wide Temperature Range

A -40 ~ 70°C operating temperature allows the ADAM-3600 to work in harsh environments and reduces maintenance costs for customers.

Remote Firmware Update

The ADAM-3600 can use a USB drive and an SD card to automatically update the firmware so there's no need to bring a computer and execute the configuration program in the field.

Intelligent Connectivity Diagnosis Manager (iCD Manager)

Remotely monitor serial and Ethernet port status and send alarm information during communication failures to help improve intelligent monitoring.

Node ID for Batch Configuration

Each ADAM-3600 has a node ID as its name to support batch configuration (max.64) with the configuration utility. When an alarm is displayed on the utility, customers can directly find the fault source with the node ID.

Introduction

ADAM-3600/TCP is an intelligent I/O module which provides 16 digital inputs, 8 relay outputs and 4 I/O expansion slots for many different scenarios. With data logging and data process functions, it can transmit truly useful data to users. In addition, ADAM-3600/TCP has a built-in web server so users can remotely acquire I/O data from any web service or smart device without routing from the SCADA system.

Features

Flexible I/O deployment

The ADAM-3600 can approach different scenarios by switching I/O expansion modules. Users can easily change and expand ADAM-3600's I/O deployment by applying on board I/O and switching the I/O expansion modules.

Datalog by either a USB storage device or a SD card

ADAM-3600 is able to log its data with either a USB storage device or an SD card to prevent data loss and provide data for analysis.

Built-in Switch

The ADAM-3600 can apply Daisy Chain topology, which can save on wiring costs and space.

Remote monitor, control and configure through a Web browser

ADAM-3600/TCP I/O module features a built-in Web server that can be accessed by using a common Web browser, such as IE, Safari, Chrome or Firefox. There is a default Web page in HTML 5 that follows the REST software style. Users who are using remote computers or mobile devices can configure, monitor and control ADAM-3600-A1F through the Web page. This feature will bring obvious benefits to users in maintenance anywhere in the local field. Moreover, it could allow programmers to create powerful, custom Web pages using HTML5 and Java Script.

ADAM-5000 Series

Open Network and Fieldbus Solutions for Device Networking

Introduction

The Fieldbus concept will change the control environment and device characteristics of future control systems in both processing and manufacturing. Compared with traditional systems, the Fieldbus system reduces cost of cabling, commissioning, and installation. In addition, the Fieldbus system has greater reliability.

The ADAM-5000 series, a compact distributed data acquisition and control system, supports the shift toward Fieldbus-based systems. Based on popular Fieldbus data communication structures such as RS-485 and Modbus, the ADAM-5000 series now offers two different DA&C systems that allow field I/O devices to easily connect to PC network applications: the ADAM-5000 DA&C systems and the ADAM-5510 series of PC-based controllers.

Distributed I/O Systems

Ethernet-based Data Acquisition and Control System

With the ADAM-5000/TCP as your Ethernet I/O data processing center, you can monitor and control field signals at speeds of 10/100 Mbps. The best field-proven communication performance that can be reached in industrial network environments. Additionally, the popular Modbus/TCP protocol is also supported.

RS-485 based Data Acquisition and Control System

The ADAM-5000/485 system is a data acquisition and control system that can acquire, monitor and control data through multi-channel I/O modules. It communicates with a network master over a twisted-pair, multi-drop RS-485 network. Both ADAM ASCII and Modbus/RTU protocols are supported.

PC-based Controllers

Ethernet-enabled PC-based Controllers

The ADAM-5510 series of PC-based programmable controllers includes ADAM-5510M, ADAM-5510E, ADAM-5510/TCP and ADAM-5510E/TCP. They feature Intel x86-based CPUs running Datalight ROM-DOS.

Users can use Borland C 3.0 to develop the application program and then download it by the Windows-based ADAM-5510 series utility. The Ethernet-enabled feature of ADAM-5510/TCP and ADAM-5510E/TCP enables features like: FTP server, web server, TCP/UDP connections and email alarm. ADAM-5510 controllers also have high expansion capability by supporting Modbus/RTU master/slave and Modbus/TCP client/server functions.

The ADAM-5550CE features AMD GX2 CPU running Windows CE. Users can use Microsoft Visual Studio .NET to develop the application program.

The ADAM-5550KW and ADAM-5510KW series allow users to leverage the IEC 61131-3 SoftLogic programming environment to complete their automation task.

Distributed I/O Systems & PC-based Controllers

Maximum System Design Flexibility

The ADAM-5000's modular design allows users to tailor solutions based on their own requirements. Built-in programmable I/O ranges and alarm outputs enhance flexibility in system design. A variety of communication media such as twisted-pair wiring, radio modems and fiber optics are supported.

System Maintenance and Troubleshooting

The ADAM-5000 series uses hardware self-test and software diagnosis to monitor system problems. Also included is a watchdog timer that monitors the microprocessor. If the system crashes, the watchdog automatically resets the system. Node ID setting is easily accomplished by setting a DIP switch on the front of the system.

Easy Installation and Networking

The ADAM-5000 series can be easily mounted on a DIN-rail or panel. Signal connections, network modifications and maintenance are simple and quick. Building a multi-drop network only requires a single twisted pair of wires.

Proven for Industrial Environments

The ADAM-5000 series can operate in industrial environments at temperatures between -10 and 70°C, and can use unregulated power sources between 10 and 30 V_{DC}. These units are protected against accidental power supply reversals. A 3-way isolation design (I/O, power & communication) prevents ground loops and reduces the effect of electrical noise in the system.

Extensive Software Support

The ADAM-5000 series is supported by most standard process controls and HMI software. .NET Class LIB is provided for use with Windows applications. OPC drivers provide links to a wide range of HMI/SCADA software packages such as InTouch, FIX and ICONICS. Advantech data acquisition software and Advantech Studio SCADA/HMI software are both tightly integrated with the ADAM-5000 systems.

IoT Wireless I/O Modules Overview

DNA of Wireless IoT Sensing Devices

DNA 1 ▶ Data Acquisition

Broad Adoptability

The WISE-4000 series adopts major sensors in different formats with different I/O channel types and amounts.

Robust Protection

The wide operating temperature with isolation protection ensures it can be deployed in even more environments.

Easy Installation

New industrial design for quick hardware installation and also software configuration.

DNA 2 ▶ Data Processing

Data Log

Data can be buffered with a time stamp, which can then be queried or automatically pushed.

Data Conditioning

Built-in local intelligence includes filtering, scaling and other several logic rules.

Web Configuration

With an HTML5 web server, all devices with a browser can access modules for configuration and troubleshooting.

DNA 3 ▶ Data Publishing

Cloud Access

Data can be transmitted to the cloud in a secure socket without using a gateway.

RESTful Web Service

With the RESTful web service, I/O modules can seamlessly integrate with IT systems.

Direct Mobile Connectivity

Mobile devices can connect to WISE-series via Wi-Fi, to get the data and module configuration without needing other devices in between.

Data Acquisition and Sensing in IoT

IoT Architecture

There are two different ways to get the devices to the cloud. For legacy devices, an IoT gateway can be used to perform protocol translation and data aggregation. A gateway then publishes the aggregated data to the cloud. For IoT devices which support Ethernet, it can be directly connected to the cloud to provide further service if there are not many devices in the system, or the devices are widely deployed in different areas. Otherwise, an IoT gateway can be used to manage the data before publishing to the cloud to reduce the connections between cloud and devices, or reducing the network bandwidth.

IoT Architecture with Legacy Device

IoT Architecture with IoT Device

RESTful API

Representational State Transfer (REST) is a software architecture style and widely used for creating scalable web services. With the advantage of scalability, simplicity and performance, it's already adopted in IoT applications. It is based on Hypertext Transfer Protocol (HTTP) and uses verbs, like GET, POST, PUT, DELETE, etc., for web browsers to get web pages or retrieve data with remote servers. The data can be retrieved by internet media like HTML, XML, or JSON. REST is a Uniform Resource Identifier (URI) used to identify data, like using "http://10.0.0.1/analoginput/ch0" to identify the analog input value of channel 0, so the web server may retrieve a JSON file analog input value of channel 0.

Secure Socket

Compared to Modbus/TCP which is also based on TCP, RESTful API provides higher scales to be used in wide area network (WAN). Modbus/TCP does not support security, so it can only be used in local area networks (LAN). However, RESTful which uses HTTP for data retrieval, can support HTTPS (HTTP over SSL (Secure Socket Layer)) or TLS (Transport Layer Secure). For developing IoT applications, RESTful API will be a better option for publishing data to the cloud or retrieving data between devices.

IoT Wireless I/O Modules Features

Wireless Ethernet Interface

IEEE 802.11 b/g/n and Wi-Fi

The 802.11 specification is a standard for wireless LAN (WLAN) that was ratified by the Institute of Electrical and Electronics Engineers (IEEE) in the year 1997. Like all IEEE 802 standards, the 802.11 standards focus on the bottom two levels the ISO model, the physical layer and link layer. The name Wi-Fi (short for "Wireless Fidelity") corresponds to the name of the certification given by the Wi-Fi Alliance, the group which ensures compatibility between hardware devices that use the 802.11 standard. Due to misuse of the terms, the name of the standard is often confused with the name of the certification. A Wi-Fi network, in reality, is a network that complies with the 802.11 standard.

2.4 GHz Interface Comparison

2.4 GHz radio band is one of the industrial, scientific and medical (ISM) radio bands. It is the most widely used band for short-range, low power communications systems, which includes Bluetooth, Near Field Communication (NFC), wireless sensor networks (like Zigbee), and wireless LAN (WLAN). WLAN provides most bandwidth and is the widest standard used by vendors. Bluetooth offers low power consumption and is widely applied to mobile devices. The new Bluetooth standard of can automatically avoid radio band interference with WLAN by frequency hopping. ZigBee also provides low energy consumption, and it also has various network topologies. However, ZigBee cannot be used in environments with other 2.4GHz radio wireless devices. Plus, it needs its own gateway to organize the ZigBee network, and it is not compatible with other vendor's ZigBee devices.

WLAN Infrastructure

The WLAN infrastructure is organized by WLAN Access Point (AP) and WLAN Stations. The wireless client, which is the end device like a smart phone, connects to a wireless access point (AP) to join the WLAN network. The wireless server which provides the wireless network, and organizes the network for WLAN stations is called a WLAN access point (AP), or wireless adapter. WLAN APs sometime provides the function of a DHCP server with dynamically assigned IP address for WLAN stations. This kind of AP usually acts a as a network router, so it can also be called a wireless router.

Ethernet Architecture

WLAN is the easiest interface to implement into an existing Ethernet network, users just need to add an access point to an existing network to extend wireless connectivity. Because all network devices don't need to be from same vendor, it has been widely established for a wide range of different application scenarios.

HTML5 Web configuration

A web interface is the most common interface that can be accessed by most devices. Compared with .NET programmed utilities or mobile apps, a web interface has much less limitations compared to platforms. WISE modules provide web interface configuration in HTML5. By using browsers which support HTML5, like Google Chrome, Mozilla Firefox, IE or Apple Safari, users can access WISE using any devices or platform.

The new web configuration interface can automatically change its layout when using different kinds of device, and for mobile devices which have vertical screens, it will automatically adjust the layout to fit the screen of the mobile device and switch to horizontal layout when using a laptop. Before entering the page or web configuration, WISE modules provide an authorization process, meaning that users need to login with different accounts for different authorizations, which ensures the security of the module.

Wireless Operation Mode

In general, WISE modules need to stay connected to access points (AP) to be online. Users who want to connect their mobile devices to WISE modules will need to connect to the same AP as WISE modules connect to. In this case, that access point acts as a wireless switch for both Ethernet devices.

Limited AP Mode

For configuration or module diagnostics, it is not necessary to have a wireless switch. WISE-4000 series offers another network mode: Limited AP Mode. Users can connect their mobile devices to the WISE module directly without an AP. When WISE-4000 works in Limited AP mode, users can find the SSID for and connect to it as a wireless switch. This makes the configuration and diagnostics much easier.

File-based Cloud Logger and Local Data Storage

Up to 10,000 samples of local data storage

The internal flash of the WISE module can log up to 10,000 samples of data with a time stamp. The I/O data can be logged periodically, and also when the I/O status changes. Once the memory is full, users can choose to overwrite the old data to ring log or just stop the log function. When the module is powered-off, data can be kept in the module. When restarting, users can decide whether to clear all data or continue logging.

Reduce the communication time and bandwidth

In the IoT communication architecture, periodic polling takes lots of time and bandwidth. Once the data can be logged in the module, users can poll a batch of data at the same time, instead of polling each piece of data individually. In this case, user can simplify the polling mechanism and also reduce the communication interface fee.

Cloud Logger function with public cloud or private cloud

Locally stored data can not only be polled by the user, it can also be automatically pushed to the cloud. Once the logger meets the upload criteria, it will push the data to a public cloud service such as Dropbox or Baidu. This data will be saved on the cloud using a *.csv file extension and users can synchronize the data on the cloud using the application provided by the cloud provider and access it from wherever they are. Using the included RESTful API, users can configure their private cloud server and push the data to it in the JSON format. Cloud Logger provides a very flexible solution for cloud data storage making WISE modules a one stop solution from data acquisition to the cloud.

Data storage with time stamps

The definition of data in the IoT is not only the status of everything, but also includes time or location information. With a built-in Real Time Clock (RTC), WISE modules log data with a time stamp and the MAC address of the WISE module. The internal RTC can be calibrated by SNTP with the time server. Once the module been powered-off, the internal time can also be saved using the time backup battery. When users poll the data from the data logger, the time stamp will always be attached to the data.

Reducing the concerns of a wireless interface

WISE-4000 Wireless IoT Ethernet I/O Modules focus on wireless connectivity. Even though a new generation of Wi-Fi interface could be stable, users are concerned that the wireless signal maybe reduced or nonexistent. In this situation, WISE modules provide local data storage. The I/O data and system events are logged in the internal flash memory of the WISE module. So now users can fetch this logged data when communication is restored.

Modbus/RTU to Web Service or Modbus/TCP

The RS-485 port of the WISE-4051 supports Modbus, which can be used to poll the data from Modbus/RTU devices, like ADAM-4000, or ADAM-5000/485. Then you can access the data by Modbus/TCP or REST from the WISE-4051. The data can also be logged.

IoT Wireless I/O Modules Features

Quick Installation and Easy Maintenance

Changeable Antenna

For flexibility, the wireless antenna of the WISE module is not fixed. Users can replace the antenna by unscrewing it counterclockwise. Advantech only ensures the performance of the default antenna and the performance is decided by the application's environment.

LED Indicator for Diagnostics

WISE modules have an LED indicator on the front of the module. Besides the status and communication indicator, users can instantly see the network mode via an LED indicator. The LED will be ON when working in AP mode. During infrastructure mode, the LED will be OFF and the signal strength LED will be on to indicate the signal quality between the WISE module and wireless access point.

External Switches and Detailed Product Label

The I/O input setting switches are on the back of the WISE module. Users don't need to open the device to configure the I/O type. For example, users can configure the digital input contact to be dry or wet via the switches. The details of the switch will be shown on the product label for the reference. The MAC address of the module is also on the label.

Initial Switch

There is a DIP switch on the back of the device for switching the WISE module to the default factory communication settings. If the user forgets the IP address of the WISE module, or wireless communication password they can configure this switch to the OFF position for the default factory communication settings.

New Mounting Kit

WISE modules come with a new type of mounting kit. Users can use this kit for DIN-rail and wall mounting (panel mount). The new mounting kit provides easy mounting for DIN-rails, users just need to switch the hook for the mounting kit to lock or release the module on the DIN-rail. WISE modules also support stack mounting as used on Advantech's other I/O modules.

Power Supply

Power Input (Not applicable to WISE-4012E)

The WISE-4000 is designed for a standard industrial unregulated 24 V_{DC} power supply. For further applications, it can also accept 10 ~ 30 V_{DC} of power input, maximum 200mV peak to peak power ripple.

USB Power Input (WISE-4012E Only)

For the IoT developer, reliable power is an important feature. So a micro-B USB power connector is provided for powering the WISE module via the computer's USB port, mobile device's USB power adapter, or using a USB power bank. (Note: WISE modules are not battery chargeable, the USB port is only for powering up the module, not for USB communication.)

Advantech WebAccess 8.0

WebAccess Cloud Architecture

WebAccess is a 100% web based HMI and SCADA software with private cloud software architecture. WebAccess can provide large equipment vendors, SIs, and Enterprises access to and manipulation of centralized data to configure, change/update, or monitor their equipment, projects, and systems all over the world using a standard web browser. Also, all the engineering works, such as: database configuration, graphics drawing and system management and the troubleshooting can be operated remotely. This can significantly increase the efficiency of maintenance operations and reduce maintenance costs.

Business Intelligence Dashboard

WebAccess 8.0 provides an HTML5 based Dashboard as the next generation of WebAccess HMI. System integrators can use Dashboard Editor to create the customized information page by using analysis charts and diagrams which are called widgets. Ample widgets have been included in the built-in widget library, such as trends, bars, alarm summary, maps...etc. After the dashboard screens have been created, end user can view the data by Dashboard Viewer in different platforms, like Explorer, Safari, Chrome, and Firefox for a seamless viewing experience across PCs, Macs, tablets and smartphones.

Open Interfaces

WebAccess has three interfaces for different uses. First, WebAccess provides a Web Service interface for partners to integrate WebAccess data into APPs or application system. Second, a pluggable widget interface has been opened for programmer to develop their widget and run on WebAccess Dashboard. Last, WebAccess API, a DLL interface for programmer to access WebAccess platform and develop Windows applications. With these interfaces, WebAccess can act as an IoT platform for partners to develop IoT applications in various vertical markets.

Google Maps and GPS Tracking Integration

WebAccess integrates real-time data on each geographical site with Google Maps and GPS location tracking. For remote monitoring, users can intuitively view the current energy consumption on each building, production rate on each field or traffic flow on the highway together with alarm status. By right-clicking on Google Maps or entering the coordinate of the target, users can create a marker for the target and associate the real-time data of three sites with a display label. Furthermore, this function also integrates with GPS modules to track the location of the marker in Google Maps and allows it to be used in vehicle systems.

Ample Driver Support

WebAccess supports hundreds of devices. In addition to Advantech I/Os and controllers, WebAccess also supports all major PLCs, controllers and I/Os, like Allen Bradley, Siemens, LonWorks, Mitsubishi, Beckhoff, Yokogawa etc. WebAccess can easily integrate all devices in one SCADA. All of these device drivers are integrated into WebAccess and free of charge. For a complete list of WebAccess drivers, refer to webaccess.advantech.com.

Distributed SCADA Architecture with Central Database Server

SCADA nodes run independent of any other node. Each SCADA node communicates to automation equipment using communication drivers supplied with Advantech WebAccess. The Project Node is a centralized database server of configuration data. A copy of the database and graphics of all SCADA nodes is kept on the Project Node. The historical data is also stored in the database in project node.

Open Data Connectivity

Advantech WebAccess exchanges online data with 3rd party software in real-time by supporting OPC UA/DA, DDE, Modbus and BACnet Server/Client. It supports SQL, Oracle, MySQL, and MS Access for offline data sharing.

Software Requirements

- **Operating System** Windows XP (SCADA Node Only), Windows 7 SP1, Windows 8 Professional, Windows Server 2008 R2 or later
- **Hardware** Intel Atom or Celeron. Dual Core processors or higher recommended
2GB RAM minimum, more recommended

The Advantech WISE wireless sensor node (WSN) series includes WISE-4200, WISE-4400 and WISE-4600 for fulfilling different domain specific applications. WISE WSN series provides intelligent sensing ability with flexible I/O combination, serial interface and built-in sensor. Besides the easy-to-use WLAN (Wireless Local Area Network) interface which can be integrated within existing Ethernet networks, WISE-4200 series also introduces LPWAN (Low Power Wide Area Network) wireless interface which offers kilometer level communication radius using battery power. LPWAN features mean WISE modules can be deployed as indoor monitoring systems or outdoor Energy and Environment monitoring systems. Moreover, to enable simple and cost-effective IoT vertical application development, WISE WSN will provide plenty of connectivity directly with different cloud platforms or cloud applications.

IoT Wireless Monitoring Solution for iFactory 4.0

Industrial Sub-GHz IoT Wireless Solution

Application-ready Sensor Combination

The combination of I/O and sensors allow WISE-4200 to be more user-friendly for diverse applications. For example, with DI, DO, and RS-485 ports combined in a module, WISE-4200 can be quickly adapted to access control monitoring for data centers or warehouses.

Less Interference than 2.4GHz Spectrum

Compared to Wi-Fi, Bluetooth, ZigBee, or any other 2.4GHz wireless interface, sub-GHz gives less interference in high humidity locations or places already with 2.4GHz wireless.

Longer Communication Range than 2.4GHz

Sub-GHz is a kind of LPWAN (Low-Power Wide-Area Networks) which was designed for long range communication. Under the same power consumption, sub-GHz has longer communication range than 2.4GHz. (Note: Low data rate for long range)

Better Penetration Through Concrete or Steel than 2.4GHz

Sub-GHz signals can bend around concrete or steel buildings. Compared with 2.4GHz, sub-GHz has better penetration and less degradation which makes it more suitable for indoor or smart city applications.

Powered by 3.6V AA Type Lithium Battery

The low power features of sub-GHz allows sensor nodes to be powered by batteries. With 3.6V AA type Lithium batteries, the sensor node can keep communicating at up to 5 km thus reducing the effort of changing.

IoT Protocol Supported: MQTT, RESTful API

The IoT wireless sensor nodes are designed not only for automation, but also for IoT applications which can use MQTT or RESTful web API IoT protocols for cloud integration.

M2M I/O Modules Overview

Introduction

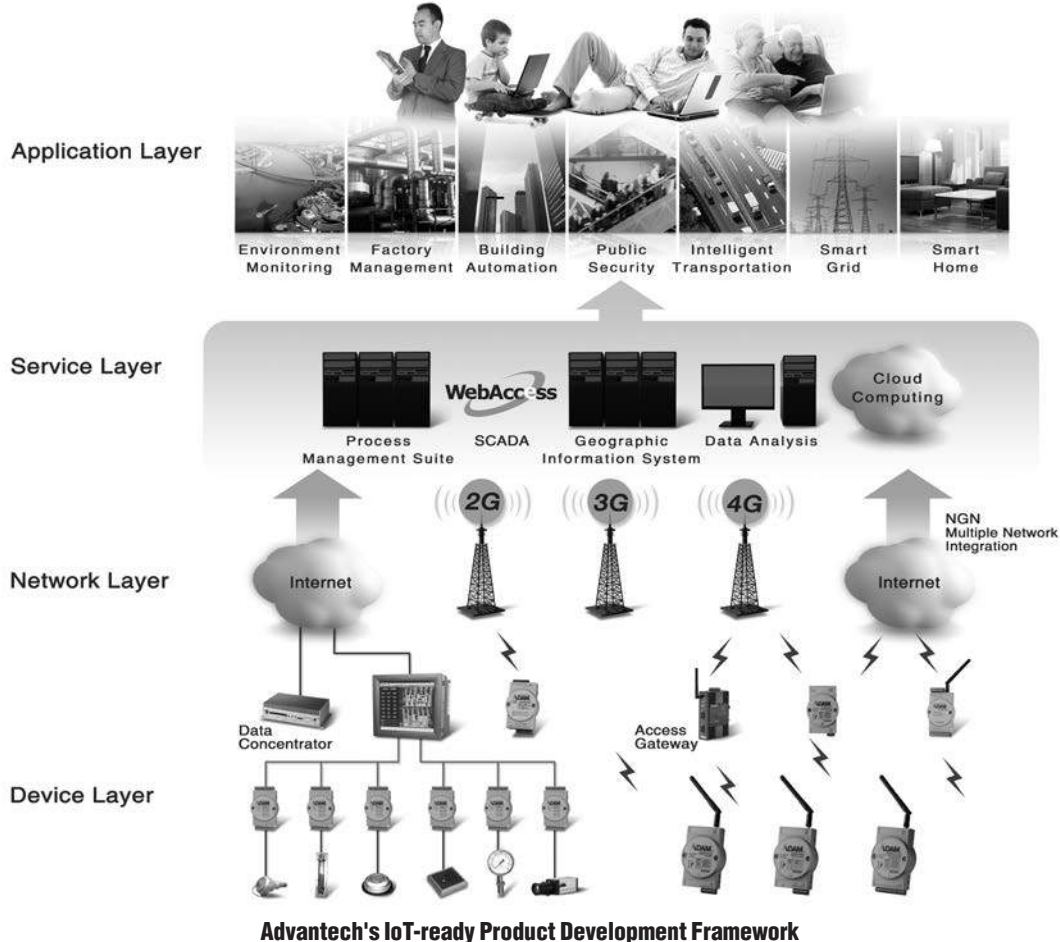

The Internet of Things (IoT) is a new paradigm gaining wide global attention from academia, industry, and government. The fundamental concept is a network of physical objects, devices, vehicles, buildings etc—denoted as things, embedded with electronics such as sensors, actuators, machine-to-machine (M2M) devices, and wireless sensor networks (WSN) that communicate and share data.

Machine To Machine (M2M) Technology

Machine To Machine (M2M) technology is now sufficiently mature that large numbers of companies are confident enough in its potential to launch their own projects that include innovation in services and products. The use of M2M technology is particularly well-suited to interaction with a large number of remote, and possibly mobile, devices, usually acting as the interface with an end-user.

Wireless Sensor Networks

The IoT is composed of four layers, an application layer, service layer, network layer and device layer. The application layer is the real application system, the service layer is now defined as cloud computing and the network layer is the wired/wireless network infrastructure. The device layer connects everything to the internet and is the key infrastructure of the IoT. One of the most important technologies is the Wireless Sensor Network, which is the wireless I/O and sensor solution/interface to collect and transmit analog/digital signals to the internet. The WSN is composed of two major parts; the wireless technology is based on IEEE 802.15.4 and the I/O technology. With different types of I/Os and sensors, signals can be measured in every situation. For instance, bridges can be measured through strain gauges, and buildings can be measured for energy usage. WSN is the next generation of wireless data acquisition solution.

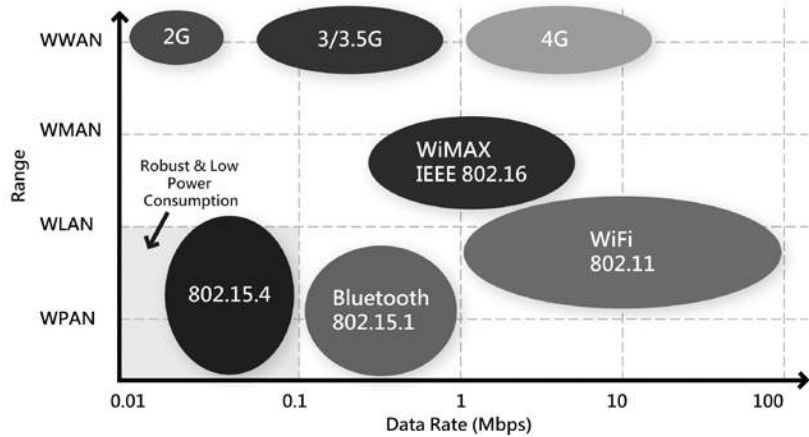

IEEE 802.15.4

IEEE 802.15.4 is defined and maintained by the IEEE organization. The standard intends to offer fundamental lower network layers of low-rate wireless personal area networks (WPANs) which focuses on low-data rates, low-power consumption ubiquitous wireless communication between devices. IEEE 802.15.4 conforming devices may use one of three possible unlicensed frequency bands for operation:

- 868.0-868.6 MHz: Europe, allows one communication channel.
- 902-928 MHz: North America, up to ten channels, extended to thirty.
- 2400-2483.5 MHz: worldwide use, up to sixteen channels.

IEEE 802.15.4 defines the Wireless Medium Access Control (MAC) and Physical Layer (PHY) for WPANs only, upper layer stacks can be implemented by users for variety of applications. One example of the known protocols is ZigBee.

Network Topologies

Wireless Sensor Networks (WSN) can be built using a few or a lot of “nodes”. Each node can be connected to one or several sensors; the network topology is composed of three typical components, PAN Coordinator/Gateway, Router and End Device (or called End Node), which can be built to Star, Tree and Mesh network topologies.

Three components of a wireless sensor network

▪ PAN Coordinator/Gateway

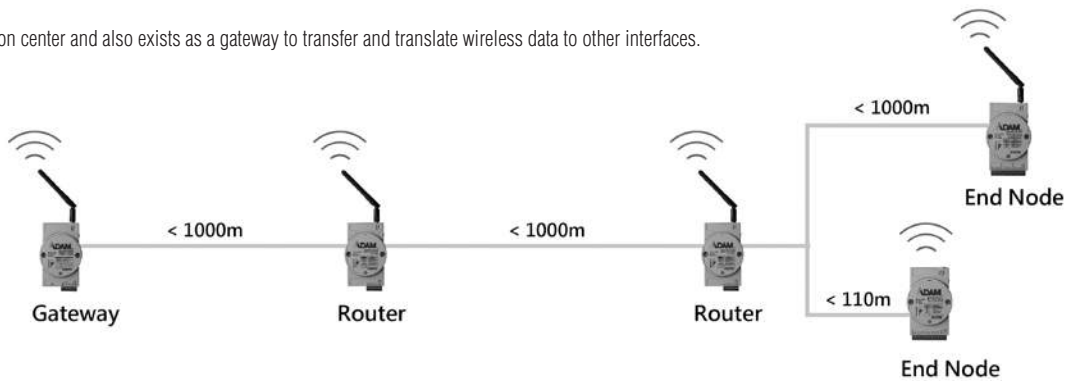

A coordinator is the data collection center and also exists as a gateway to transfer and translate wireless data to other interfaces.

▪ Router

A router enhances the wireless signal and a wireless router is used to select the optimal path for wireless communication between the coordinator and the end nodes.

▪ End Node/Device

An end node is a wireless remote I/O for data acquisition. Data is acquired from sensors or devices which are then transmitted through it. The end node communicates with the coordinator directly or via a router to a coordinator.

Three Network Topologies

▪ Star Topology

It's the simplest way to construct a network with a gateway and end nodes. The benefit of the topology is that it operates as a low-latency communication network. But has the limitation of low wireless signal coverage.

- WSN End Node
- WSN Gateway

▪ Tree Topology

Using a tree topology, the network can be extended through routers making it flexible enough to locate the end nodes in specified locations. Latency is increased with the number of routers hopping.

- WSN End Node
- WSN Gateway
- WSN Router

▪ Mesh Topology

When routers connect to each other in a mesh topology they have the following benefits.

1. Wide network coverage.
2. Robust routing mechanism with self-healing.
3. Multi-hopping mechanism.

But also the following limitations:

1. More power consumption than the other topologies.
2. Routing path and hop counts affect the latency and performance.

- WSN End Node
- WSN Gateway
- WSN Router

M2M I/O Modules Overview

ADAM-2000 Series

Advantech provides ADAM-2000 series industrial grade Wireless Sensor Network I/O solutions for low-power consumption, cost-efficient and reliable networking for remote monitoring applications. It utilizes IEEE 802.15.4 wireless technology and supports star, tree and mesh topologies. Once the modules are configured, the ADAM-2000 series will automatically construct the most suitable network topology for your control system without further configuration.

The ADAM-2000 series contains several models, including coordinator (gateway), router, analog input, digital input, and sensor modules. To perform as a Wireless Sensor Network, a gateway ADAM-2520Z is essential for collecting data from end nodes. With the Modbus RTU protocol, the ADAM-2000 series can be easily integrated into any SCADA or Modbus RTU compliant system.

- **ADAM-2520Z:** Wireless Modbus RTU Gateway
- **ADAM-2510Z:** Wireless Router
- **ADAM-2017PZ:** Wireless 6-ch Analog Input Node with Power Amplifier
- **ADAM-2031Z:** Wireless Temperature & Humidity Sensor Node
- **ADAM-2051Z:** Wireless Sensor Network 8-ch Digital Input Node
- **ADAM-2051PZ:** Wireless Sensor Network 8-ch Digital Input Node with Power Amplifier

Features

Advantech's ADAM-2000 Series are wireless I/O devices designed for industrial systems and applications.

2.4GHz IEEE 802.15.4

Global Deployable ISM 2.4GHz IEEE 802.15.4 Standard

The standard has the following benefits.

- With the global deployable ISM 2.4 GHz RF band, the ADAM-2000 series can be installed worldwide.
- Compared to a wired solution, wireless technology makes the network easily extendible and can be installed in almost any location, especially in distributed construction applications.
- Enhances transmission power and high gain antennas can expand network coverage.
- Enlarges highly effective network structure to reduce development costs and maintainable complexity in harsh applications.
- Provides self-forming and self-healing ability to cope with communication failures or node failures conditions.
- Low data rates and low duty cycles make it possible to act as standalone devices with batteries for a long term operation without maintenance.

Low-power Consumption

Low Power Consumption Design

The ADAM-2000 series is designed for applications that require long-time operation without maintenance. Therefore power consumption is taken into consideration during its design. The ADAM-2000 series not only follows the IEEE 802.15.4 standard for low-power consumption wireless communication, but also optimizes the peripheral hardware and firmware design to achieve uA-level power consumption. This allows ADAM-2000 input/output and sensor modules to be powered by 2 AA Alkaline batteries*.

Industrial Communication and I/O Interfaces

The popular industrial communication protocol Modbus makes the ADAM-2000 series easy to integrate with industrial systems and is also compliant with ADAM-4000 and ADAM-6000 wired solutions. Multiple I/O interface selection provides users plentiful sensor options.

* We suggest using Energizer L91 Ultimate Lithium AA batteries.
* Only the ADAM-2031Z and ADAM-2051Z support low power consumption. For other modules batteries can still be used as back-up power.

SCADA Software Support

Advantech and Industrial SCADA Software Support

The ADAM-2000 series can be configured through the Adam/Apax .NET Utility. Only a few steps are required, and wireless networks can be built up quickly. Due to the Modbus protocol design, the ADAM-2000 series can support any third-party SCADA software and HMI, including Advantech SCADA software, WebAccess.

Ensured Data Design

The ADAM-2000 family has a tracking mechanism feature to ensure data communication processes can be successfully transferred between the coordinator and end device before the device enters sleep mode.

Event Triggering

ADAM-2000 digital input modules are empowered with an Event Triggering function. When receiving DI status change, ADAM-2000 digital input modules will wake up immediately from sleep mode and send I/O data to a coordinator. This avoids the missing of events during operation.

Over The Air (OTA) Firmware Update

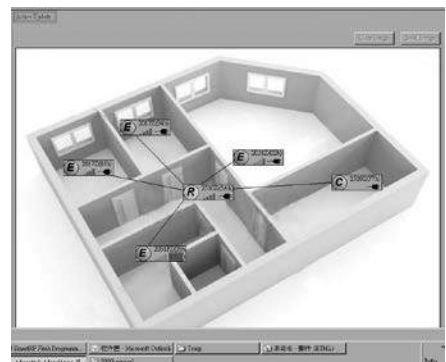

ADAM-2000 modules with strengthened firmware have a stable backup buffer and security mechanism allowing wireless module firmware updates during operation.

Site Survey Monitoring

ADAM-2000 modules provide the Adam/Apax .Net utility to achieve easier network setup and remote maintenance tasks. The topology monitoring of ADAM-2000 network uses a drag and drop interface allowing users to choose the working field image for monitoring backgrounds, and lists the relations among ADAM-2000 modules all illustrated on a single page.

Through site survey monitoring, users can comprehensively learn about each device location, current status and information in customized background.

The Path to Seamless Integration

The integration of automation and enterprise systems requires a change in the architecture of open control systems. From Advantech's point of view, the level of integration between automation and enterprise systems can only be accomplished through Internet technology. It is believed that IP/Ethernet protocols will progress beyond the control layer, into the field layers. Placing remote I/O with IP/Ethernet connections on the shop floor is economical. Advantech believes that over the next five years, Internet protocols over Ethernet will dominate major field connections. The Advantech ADAM-6000 series offers ideal remote I/O solutions with Internet protocols for industrial automation environments.

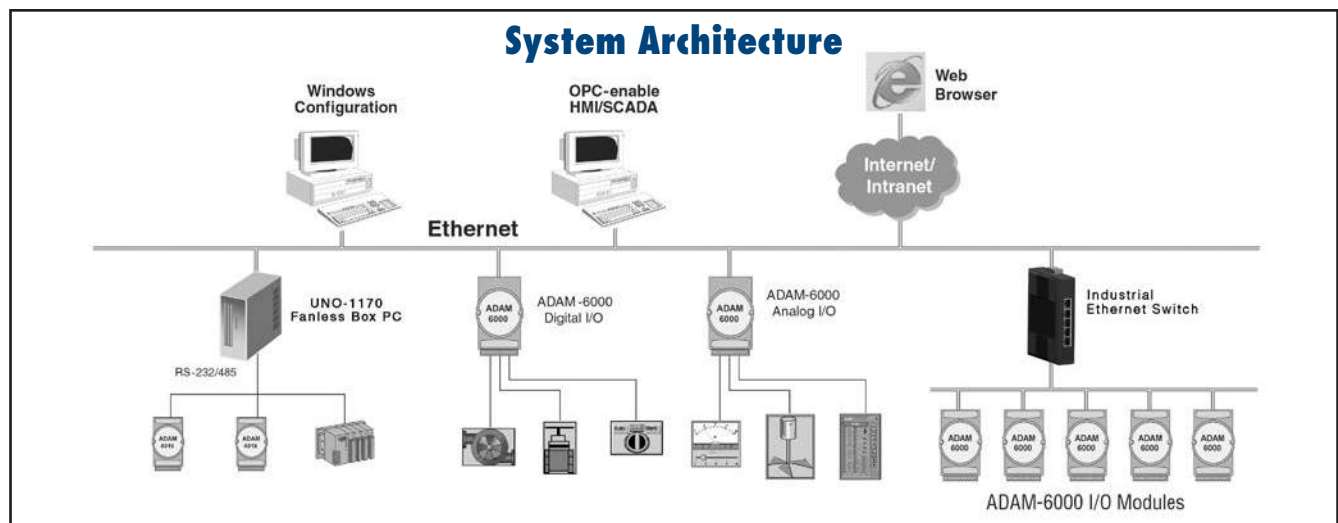

ADAM-6000 firmware features a built-in Modbus/TCP server. Advantech provides the ADAM.NET Utility, ADAM.NET class library and OPC Server for the ADAM-6000 series to support these functions as well. Users can configure DA&C systems via ADAM.NET Utility and integrate it with an HMI software package via Modbus/TCP driver or Modbus/TCP OPC Server. Furthermore, users can easily use the ADAM.NET class library to develop their own applications.

Web-enabled Technology Becomes Popular on Factory Floors

As Internet technologies and standards have rapidly developed over the past decade, Web-based control methodologies now obviously represent a powerful opportunity for extending efficient network-based management techniques to encompass non-IT real-world assets.

The ADAM-6000 series is equipped with a built-in web server so that its data can be viewed, anytime-anywhere via the Internet. Moreover, the ADAM-6000 series allows users to configure user-defined web pages to meet the diverse needs in various applications. With this powerful function, the ADAM-6000 series breaks the boundary of traditional multi-layer automation architecture and allows users to access field data directly in real time, which enables seamless integration between the plant floor and the front office.

HMI has provided a friendly operator interface for discrete control and sharply reduced the cost and complexity of automation systems. A web server has been added to most HMI software and a browser allows access to HMI displays from remote locations via the network. The end user is able to see and use an identical HMI from any Internet connected computer anytime, anywhere. ADAM-6000 series can be fully integrated with standard HMI software which supports Modbus/TCP.

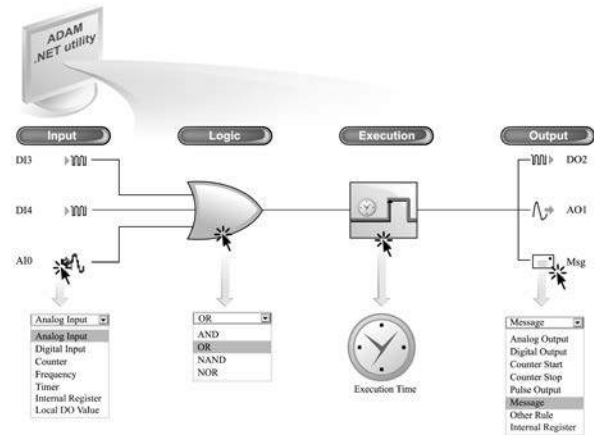

ADAM-6000 GCL Features

Using Ethernet I/O Modules as Controllers

What is GCL?

Graphic Condition Logic (GCL) gives Ethernet I/O modules controllability. Users can define the control logic rules using the graphic configuration environment in the ADAM series and download defined logic rules to ADAM-6000 Ethernet I/O modules. The Ethernet I/O module will then execute the logic rules automatically just like a standalone controller. For each Ethernet I/O module, 16 logic rules can be defined. In the configuration environment of ADAM.NET Utility, four graphic icons show the four stages of one logic rule: Input, Logic, Execution and Output (Refer to figure below). Users can simply click on each icon and a dialog window will pop-up for users to configure each stage. After completing all configurations, users can click a button to download the defined logic rules for their specific Ethernet I/O module.

ADAM-6000 GCL is the Simplest Logic Ethernet I/O

Complete Graphic Configuration Environment

Unlike other text-based logic configuration utilities, Advantech GCL provides a complete graphic configuration utility, which is very intuitive to use. By simply clicking the icons, all related configurations can be made through the pop-up dialog window. GCL is not only easy-to-use, but it also offers powerful functionality.

Supports Both Local and Remote Output

When users define the destination of output stage (such as digital output, analog output, counter and pulse output), users can choose either the local module or another remote module as the target.

Cascade Logic

The output of one logic rule can be another rule. Therefore, different rules can be combined together. GCL provides this kind of functionality called Cascade Logic. For example, if users combine rule 1 and rule 2 with rule 3, the maximum inputs become seven. (Two inputs of rule 3 will be rule 1 and rule 2. Refer to figure below.) So users can define complex logic architecture to satisfy various application requirements.

Distributed Cascade Logic

Users can assign other rules as the output of one logic rule. In fact, that "other rule" can be on the same module, or on another remote module. So, one GCL logic architecture can operate across different modules. Several Ethernet I/O modules can be integrated into one complete logic system.

Feedback

Users can assign input and output of logic rule to the same internal register. This gives GCL feedback ability. No hardware wiring is needed.

Rich I/O Options

Analog Input	Thermocouple, RTD, Voltage, Current
Analog Output	Voltage, Current
Digital Input	Dry Contact, Wet Contact, Counter/Frequency input
Digital Output	Sink, Source, Relay output, Pulse output

Fast Execution Time

Advantech GCL feature the shortest logic rule execution time in the market. When you choose local output (input and output channels are on the same module), the processing time (including hardware input delay time, logic rule, execution time, and hardware output delay time) is less than 1 millisecond. When you choose remote output (input and output channel are on different modules), the total time needed (including processing and communication time) is less than 3 milliseconds.

Analog Input Scaling

When configuring analog input conditions, GCL provides a linear scaling function to convert measured voltage/current values to its engineer unit value (such as temperature or pressure unit). Then users can use the engineer unit value to define the logic condition, making it is more intuitive.

Online Monitoring

After users complete all GCL configurations in the ADAM.NET Utility, they can simply click the "Run Monitoring" button. Then users can see the real-time execution workflow of the logic rule on ADAM-6000 modules. Current input values will also be displayed, this helps users to easily maintain the system.

Sending Messages

In GCL, you can define your customized message. When conditions are satisfied, The message, module's IP and I/O status will be sent to defined PC or device.

Local DO Status Can be Input Condition

In GCL, you can read the local DO channel value and use it in the input condition. So you can define logic rules based on the local DO status.

ADAM-6000 Features: Peer-to-Peer

Requirements

A client has three branch offices across multiple countries. For each branch, cameras were installed near the entrance gates. At the headquarters, people in the control room monitored each gate via the Internet. They also wanted to enhance the system so as to remotely control each gate from inside the control room at their headquarters. Since the distance between the headquarters and each branch was thousands of miles, it was a difficult challenge to establish a reliable network communication link.

Solution

Through three pairs of Advantech ADAM-6000 Peer-to-Peer Ethernet I/O modules (without any additional hardware), the application request was easily solved. For each pair of ADAM-6000 modules, one module was placed inside the headquarters control room and another was located at each branch. When the headquarters module was activated, it notified its paired module at the branch to open or close the gate. Communication is Ethernet-based, so the client could easily leverage their existing Ethernet infrastructure.

What is Peer-to-Peer?

Unlike client / server mode, Peer-to-Peer enabled modules will actively update input channel status to a specific output channel. There will be a pair of modules: one input module and one output module. Users can define the mapping between them and the input value will be transferred to the output channel.

What Benefits Do Peer-to-Peer Modules Provide?

No Controller Required

For Ethernet I/O modules without Peer-to-Peer functionality, a controller is needed to read data from the input module and then send data to the output module. With Peer-to-Peer solutions, the controller can be removed since data will automatically transfer. This not only simplifies the process, but also helps save system hardware costs.

No Programming Required

To utilize Peer-to-Peer modules, the only thing required is to configure settings through the ADAM .NET Utility. No additional programming effort is needed, thereby reducing system development time.

Simple and Flexible System Wiring

Long distance wiring can be difficult. For some automation applications, if the PLC and the sensors are far away, one remote I/O module needs to be located near the sensors and a proprietary communication network needs to connect the PLC and the remote I/O module, but communication will be severely limited. Moreover, networks provided by PLC manufacturers are rarely open. Peer-to-Peer modules can replace limited and closed networks with no limitations since they leverage the most open and flexible Ethernet networks.

Why is Advantech's Peer-to-Peer Technology the Best Choice?

Flexible Channel Mapping

ADAM-6000 Peer-to-Peer modules provide two modes: Basic and Advanced. For Basic mode, channels on one input module are directly mapped to channels on another single output module. For Advanced mode, channels on one input module can be mapped to channels on different output modules. (Refer to figure below)

Fast Response Time

Advantech Peer-to-Peer modules offer the best execution times in market. The execution time to transfer data from input to output is less than 1.2 millisecond.

Advanced Security

When engineers use Peer-to-Peer modules, they don't want them to be controlled by non-authorized computers or devices. ADAM-6000 Peer-to-Peer modules lets users decide which IP or MAC address has control authority. This can make sure the output module is only controlled by its paired input module.

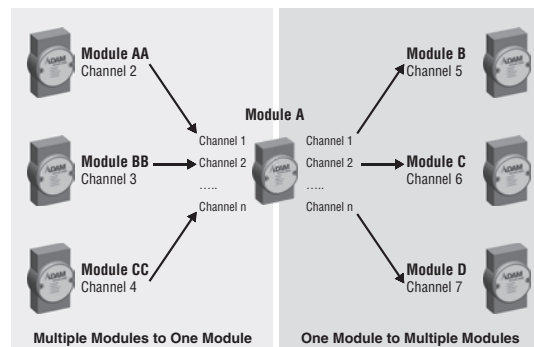

Advanced Reliability

When communication between a pair of ADAM-6000 Peer-to-Peer modules is broken, the digital output module can generate pre-defined values to ensure safety.

Transition and Vision on Remote DAQ Device

In 2002, Advantech released its first Ethernet I/O module, ADAM-6000 series, which aims to provide ideal remote Ethernet I/O solution for industrial automation environments. It could work as a standalone station to conduct data acquisition, processing and delivery reliably in diverse of automation applications such as factory automation, EFMS and building automation.

However, as of today, the information technologies and network infrastructure are getting well-developed in the world. More and more enterprises not only face the requirement of enhancing their existing automation systems for greater overall equipment effectiveness (OEE), but also need up-to-date information integration, plant management and business systems. In the same way, the remote DAQ modules should be evolved to make it more effective, interoperable, and smarter than before to meet new requirements.

In the future, there are plenty of potential key elements like intelligence, energy-efficiency, cloud computing, cyber-security and mobile communication technologies being progressively leveraged in automation market. We believe that these will also contribute to ideal remote DAQ devices in IoT world.

In order to fulfill the transition of requirements and future applications, Advantech releases ADAM-6200 series, a new selection of Ethernet I/O family comprised of analog I/O, digital I/O and relay modules. ADAM-6200 series module possesses plenty of advanced features whatever the evolution of hardware design and what's worth expecting for user is a variety of useful software functions to make it effective in the application field. With new design and strong capabilities, ADAM-6200 can be a well-integrated I/O solution in Ethernet control systems.

ADAM-6200 Key Features

Flexible Deployment with Daisy Chain Networking and Auto-Bypass Protection

ADAM-6200 module has built-in Ethernet switches to allow daisy chain connections in an Ethernet network, making it easier to deploy, saving wiring costs, and helping improve scalability. The two Ethernet ports are fully compliant with IEEE 802.3u 10/100Mbps through standard RJ-45 connectors.

Although daisy chain topology brings attractive benefits for user, it still comes with the risk that once any device in the daisy-chain network suffers power outage, it will cause the disconnection of all devices data stream

Auto-bypass Protection

To prevent this critical issue from happening, Advantech especially refines the hardware design of ADAM-6200 so that it can rapidly recover the network connection in about 2.5 seconds. Therefore, the damage will be greatly minimized.

Remote Monitoring and Control with Smart Phone/Pad

In early stage of automation, it's hard to access or obtain the data of equipments online when conducting on-site inspection. Mostly, the possible way to do that is communicating with engineers in branch or central control room where the SCADA program is running. It always takes extra efforts to complete an on-site checking or debugging.

The ADAM-6200 series module integrates the latest Web language HTML 5, allowing users to remotely monitor the status of all online modules without bridging SCADA system and to perform basic I/O configurations on any built-in HMI devices such as Smart Phone, Smart Pad over the Internet. Moreover, users can further develop its extended applications based on the default HTML 5 file embedded in the module.

HTML 5

HTML is a markup language popularly used to program the content for Web page over the Internet. The fifth revision (HTML 5) is the latest version which enhances its syntax structure and additionally mixes up with rich Web technologies like CSS, JavaScript to implement more Web service, API, interactive applications in mobile communications.

Group Configuration Capability for Multiple Module Setup

In certain application scenario, it requires to set multiple modules with the same settings because these modules are doing the same tasks on different sites. Users have to set configurations of module one after another before onsite deployment. After the modules are installed and the system is running, it will still require repetitive efforts in maintenance when doing firmware update.

ADAM-6200 series modules are equipped with group configuration capability to reduce the repetitive efforts and quickly finish the multiple module setups, including firmware upgrade, configuration and HTML 5 file at one time. Users can finish the module installation faster than before as the configuration time tremendously reduced.

EtherNet/IP & Profinet I/O Module Introduction

Real-time distributed control systems are an important technology for reliable industrial Ethernet and automation applications. A number of techniques are used to adapt the Ethernet protocol for industrial processes, which must provide reliable service to ensure stable operation. With modern protocols, automation systems from different manufacturers can be interconnected throughout a plant. Industrial Ethernet takes advantage of the relatively larger marketplace for computer interconnections to reduce cost and improve performance of communications between industrial controllers.

Real-time Systems

A real-time system is one in which the correctness of a result not only depends on precise calculations, but also upon accurate timing. In computing, real-time refers to a time frame that is very brief, appearing to be immediate. When a computer processes data in real time, it reads and handles data as it is received, producing results without delay. A non real-time computer process does not have a deadline. Such a process can be considered non-real-time, even if fast results are preferred. A real-time system, on the other hand, is expected to respond not just quickly, but also within a predictable period of time. In an automation control system, real time technology provides multiple advantages, such as improved safety, quality, and efficiency. To build a real-time distributed control system, it is critical to establish reliable real-time communication among the controllers, so there is now an increasing interest in the use of Ethernet as the link-layer protocol, such as EtherNet/IP, PROFINET, EtherCAT, Ethernet PowerLink, SERCOS III.

EtherNet/IP

EtherNet/IP was developed in the late 1990's by Rockwell Automation for use in process control and other industrial automation applications, ensuring multi-vendor system interoperability. EtherNet/IP is a lot like standard office Ethernet, using the same TCP/IP messaging but with a new application layer added where data is arranged. This is known as Object-Orientated Organization, and allows ordinary office Ethernet to become a more versatile system. Today, EtherNet/IP is commonly used in industrial automation applications, such as water processing, manufacturing and utilities.

Profinet

PROFINET, the standard for industrial networking in automation, connects devices, systems, and cells, facilitating faster, safer, less costly and higher quality manufacturing. As it's fully compatible with office Ethernet it easily integrates existing systems and equipment while bringing enhanced features such as real-time performance and control and monitoring functions as well as the ability to withstand harsh industrial environments. In addition to the above, PROFINET also features highly scalable architectures, remote access and maintenance of field devices over the network, and lower production/quality data monitoring costs.

Introduction

The ADAM-4000 series modules are compact, versatile sensor-to-computer interface units designed specifically for reliable operation in harsh environments. Their built-in microprocessors, encased in rugged industrial grade plastic, independently provide intelligent signal conditioning, analog I/O, digital I/O, data display and RS-485 communication. The ADAM-4000 series can be categorized into three groups: controllers, communication modules, and I/O modules.

General Features

RS-485

The ADAM-4000 series of modules use the EIA RS-485 communication protocol, the industry's most widely used bi-directional, balanced transmission line standard. The EIA RS-485 was specifically developed for industrial applications. It lets ADAM-4000 modules transmit and receive data at high rates over long distances. All modules use optical isolators to prevent ground loop problems and reduce damages caused by power surges.

Modbus Communication Protocol

Since Modbus is one of the most popular communication standards in the world, Advantech has applied it as the major communication protocol for eAutomation product development. The new-generation ADAM-4000 modules now also support the Modbus/RTU protocol as the remote data transmission mechanism. Featuring the Modbus-support capacity, the new ADAM-4000 series becomes universal remote I/O modules, which work with any Modbus systems. The HMI server or controller can read/write data via standard Modbus command instead of complex ASCII code.

Watchdog Timer

A watchdog timer supervisory function will automatically reset the ADAM-4000 series modules if required, which reduces the need for maintenance. It also provides great reliability to the system.

Flexible Networking

ADAM-4000 series modules need just two wires to communicate with their controlling host computer over a multidrop RS-485 network. Their ASCII-based command/response protocol ensures compatibility with virtually any computer system.

Modular Industrial Design

You can easily mount modules on a DIN-rail, a panel or modules can piggyback on top of each other. You make signal connections through plug-in screw-terminal blocks, ensuring simple installation, modification and maintenance.

Controller Features

Alternative Standalone Control Solution

A standalone control solution is made possible when the ADAM-4000 series modules are controlled by the ADAM-4501 or ADAM-4502 PC-based communication controller. The ADAM-4501 and ADAM-4502 allow users to download an application (written in a high-level programming language) into its Flash ROM. This allows customization for your applications.

Remote Data Acquisition and Control Modules Overview

I/O Module Features

Remotely Programmable Input Ranges

The ADAM-4000 series modules stand out because of their ability to accommodate multiple types and ranges of analog input. The type and range can be remotely selected by issuing commands from a host computer. One type of module satisfies many different tasks, which greatly simplifies design and maintenance. A single kind of module can handle the measurement needs of a whole plant. Since all modules are remotely configured by the host computer, physical adjustments are unnecessary.

Easy Plug-in System Integration

With ADAM-4000's Modbus I/O, and built-in Modbus/RTU protocol, any controller using the Modbus/RTU standard can be integrated as part of an ADAM-4000 control system. Any Modbus Ethernet data gateway can upgrade these I/O Modules up to the Modbus/TCP Ethernet layer. Most HMI software is bundled with a Modbus driver, and can access the ADAM-4000 I/O directly. Moreover, Advantech provides Modbus OPC Server and Modbus/TCP OPC Server as data exchange interfaces between the ADAM-4000 Modbus I/O and any Windows Applications.

Communication Module Features

Ethernet

ADAM-4570 and ADAM-4571 are designed for the connection between serial devices (RS-232/422/485) and Ethernet. With ADAM-4570 or ADAM-4571, you can use graphical control software to monitor and control I/O modules. With existing devices, you can connect to an Ethernet network with the benefits of enhanced host performance and convenience.

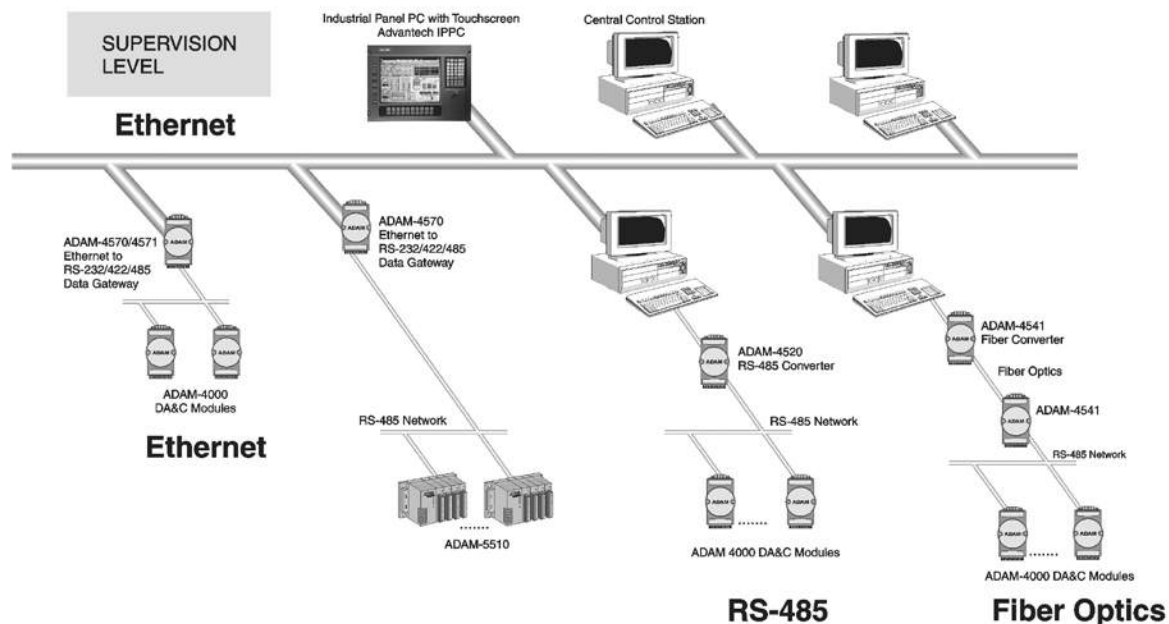

Fiber Optics

If users need to transmit over long distances without noise interference, ADAM-4541 and ADAM-4542+ are designed for this task. The ADAM-4541 is a multi-mode converter, which carries signals from fiber optics to RS-232/422/485. It offers a transmission distance of up to 2,500 m with a total immunity to electromagnetic noise. The ADAM-4542+ is a single-mode converter, which carries signals from fiber to optics to RS-232/422/485. It offers a transmission distance of up to 15 km with total immunity to electromagnetic noise.

USB Communications

ADAM-4561/4562 is an one-port isolated USB to RS-232/422/485 converter. ADAM-4561 can convert USB to RS-232/422/485 with plug-in terminal. The major features of ADAM-4562 are the capability to use 9-wire RS-232, and to get power from the USB port. With 9-wire RS-232 capability, this converter meets the requirements of PLCs, modems, and controller equipment. As a USB-to-serial converter, ADAM-4562 supports Plug & Play, and hot-swapping, which simplifies the configuration process, and it also acts as a power supply for the module. It is no longer necessary to have an external power supply.

ADAM-4100 Series

Robust Remote Data Acquisition and Control Modules Overview

Introduction

The robust ADAM-4000 family includes the ADAM-4100 series modules, ADAM-4510I and ADAM-4520I modules. The ADAM-4100 series are compact, versatile sensor-to-computer interface units designed for reliable operation in harsh environments. Their built-in microprocessors, encased in rugged industrial-grade ABS+PC plastic, independently provide intelligent signal conditioning, analog I/O, digital I/O, LED data display, and an address mode with a user-friendly design for convenient address reading. The ADAM-4510I and ADAM-4520I modules are robust industrial-grade communication modules.

The ADAM-4000 robust family is designed to endure more severe and adverse environments. The operating temperature is $-40 \sim 85^{\circ}\text{C}$ which makes them suitable for more widespread applications.

Designed for Severe Industrial Environments

Broader Operating Temperature Range

The ADAM-4000 robust family supports a broad operating temperature range of -40 to 85°C .

Higher Noise Immunity

In order to prevent noise from affecting your system, the ADAM-4000 robust family has been designed with more protection to counteract these effects. New standard features include: 1 kV surge protection on power inputs, 3 kV EFT, and 8 kV ESD protection.

Broader Power Input Range

The ADAM-4000 robust family accepts any unregulated power source between 10 and $48 V_{\text{DC}}$. In addition, they are also protected against accidental power reversals, and can be safely connected or disconnected without disturbing a running network.

New Features for I/O Modules

- **ADAM-4117/4118**
 1. Supports $200 V_{\text{DC}}$ High Common Mode voltage
 2. Software Filter
 3. Supports Auto Optimized Working Frequency
 4. Auto noise rejection at 50/60 Hz
 5. Higher over voltage protection $\pm 60 V_{\text{DC}}$
 6. Optional Sampling Rate 10 or 100 samples/sec
 7. Supports unipolar and bipolar input (ADAM-4117 only)
 8. Supports $\pm 15\text{V}$ input range (ADAM-4117 only)

- **ADAM-4150**

1. Over current and temperature protection circuit
2. DI channels support counter (32-bit, overflow flag) and frequency type signal input
3. DO channels support pulse (1 kHz) and delay (high-to-low and low-to-high) type signal output
4. Support invert DI status

- **ADAM-4168**

1. Supports 1 kHz pulse output

ADAM-4100 Module with LED Display

The ADAM-4100 series modules have a LED display that lets you monitor the channel status. Using ADAM-4117/4118, the LED will be lit when related channel is active. Using ADAM-4150/4168, the LED will be lit when related channel value is high. The ADAM-4100 series modules have two operating modes (initial and normal), unlike the old module using extra wiring, ADAM-4100 modules can use the switch on the case to set "initial" mode or "normal" mode. It is very convenient for the user to configure. When you set to "initial" mode, the LED display can represent the node address of that module. Besides, when you use multiple ADAM-4100 series modules, you can locate the module through ADAM utility and LED display. All of these functions are very helpful to diagnose the ADAM-4100 series system.

Online Firmware Updates

The ADAM-4100 series modules have a friendly and convenient design where firmware can be updated through a local network or the Internet. You can easily update latest firmware using utility on host PC. This saves time and ensures that the module always runs with the latest functional enhancements.

Legacy Communication Protocol Support

To satisfy both the current ADAM users, and Modbus users, The ADAM-4100 series modules support both the ADAM (ASCII) protocol and the Modbus/RTU protocol. You can select the communication mode you want through the Windows Utility Software. The Modbus protocol not only supports the original data format (N, 8, 1) for (parity check, data bit, stop check) but also accepts (N,8,1) (N, 8, 2) (E, 8, 1) (O, 8, 1).

Introduction

The EKI-5729F/FI are the world's first convergence switches for process control and IT networking management. This series uses Modbus/TCP to communicate with the SCADA software and SNMP to communicate with the NMS (Networking Management System) at the same time, thereby allowing full read control over the devices either for control engineers or for IT. The devices come with the Port-based QoS for deterministic data transmission allows the priority ports to prioritize the traffic coming over those ports and delay the less immediately necessary data over the remaining ports. EKI-5729F/FI switches use the highest quality components, to enable the range to operate in temperatures of between -40 and 75°C along with EMS Level 3 protection to repel electromagnetic interface for industrial resistance.

Introduction

The EKI-5629C/CI and EKI-5626C/CI is the world's first convergence switches for process control and IT networking management. This series uses Modbus/TCP to communicate with the SCADA software and SNMP to communicate with the NMS (Networking Management System) at the same time, thereby allowing full read control over the devices either for control engineers or for IT. The devices come with the Port-based QoS for deterministic data transmission allows the priority ports to prioritize the traffic coming over those ports and delay the less immediately necessary data over the remaining ports. EKI-5629C/CI and EKI-5626C/CI switches use the highest quality components, to enable the range to operate in temperatures of between -40 and 75°C along with EMS Level 3 protection to repel electromagnetic interference for industrial resistance.

EKI-7626C/CI

16+2G Combo Port Gigabit Unmanaged Industrial Ethernet Switch

Features

- Provides 2 Gigabit Copper/SFP combo port plus 16 Fast Ethernet ports (EKI-7626C/CI)
- SFP socket for Easy and Flexible Fiber Expansion
- Supports Auto Negotiation and Auto MDI/MDI-X
- Provides flexible mounting: DIN-rail and Wall mount
- Supports Dual 12 ~ 48 V_{DC} power input and 1 relay output
- Supports wide operating temperatures from -40 to 75°C (EKI-7626CI)

Introduction

Aside from 2 Gigabit fiber optic/copper combo ports, the EKI-7626C/CI comes equipped with 16 x 10/100Base-T (X) fast Ethernet ports. Traditional RJ45 ports can be used for up-linking wide-band paths in short distances (< 100 m), or the appropriate replaceable SFP module can be used for the application of wideband uploading and long distance transmissions to flexibly fit field requests. The long MTBF (Mean Time Between Failures) ensures low operation and maintenance cost. EKI-7626C/CI includes a switch controller that can automatically sense transmission speeds (10/100 Mbps) The RJ45 interface can also be auto-detected, so MDI or MDI-X is automatically selected and a cross-over cable is not required. All Ethernet ports have memory buffers that support the store-and-forward mechanism, which assures that data can be transmitted properly

EKI-7529MI/ST

8+2 Multi-Mode Fiber Optic Industrial Unmanaged Ethernet Switch with Wide Temperature

Features

- Provides ST type fiber optic ports plus 8 Fast Ethernet ports
- Supports Auto Negotiation and Auto MDI/MDI-X
- Provides flexible mounting: DIN-rail and Wall mount
- Supports Dual 12 ~ 48 V_{DC} power input and 1 relay output
- Enable or disable broadcast storm protection through a simple dip switch
- Supports wide operating temperatures -40 ~ 75°C

Introduction

EKI-7529MI/ST come equipped with 8 x 10/100Base-TX fast Ethernet ports. Traditional ST fiber optic ports can be used for uplinking and long distance transmissions to flexibly fit field requests. The RJ45 interface can also be auto-detected, so MDI or MDI-X is automatically selected and a cross-over cable is not required. All Ethernet ports have memory buffers that support the store-and-forward mechanism, which assures that data can be transmitted properly. Furthermore, the power line of EKI-7529MI/ST supports Surge and EFT protection which secure equipment against unregulated voltage and make systems safer and more reliable.

Introduction

EKI-2525M/2526M/2526S are industrial-grade Ethernet switches that enable you to expand your industrial network fast and cost-effectively. The EKI-2525M/2526M/2526S have four 10/100 Mbps Ethernet ports, and additionally the EKI-2525M/2526M provides one or two multi-mode fiber-optic ports, while the 2526S provide one or two single-mode single-mode fiber-optic ports. Using fiber-optics, you can prevent noise from interfering with your system and supports high-speed (100 Mbps) and high-distance (up to 30 km) transmissions.

EKI-2525M/2526M/2526S have industrial-grade designs, assuring high reliability and stability in harsh environments, making it a robust bridge between enterprise fiber-optic backbones and Ethernet devices. EKI-2525M/2526M/2526S includes a switch controller that can automatically sense transmission speeds. The RJ45 interface can also be autodetected, so MDI or MDI-X is automatically selected and a crossover cable is not required. All the Ethernet ports have memory buffers that support the store and forward mechanism, assuring all data is transmitted properly.

Introduction

The EKI-2741 is designed to convert Gigabit Ethernet networks to Gigabit fiber networks by transparently converting Ethernet signals to optic signals. Therefore, the EKI-2741 is an ideal solution for "fiber to building" applications at central offices or local sites. EKI-2741 supports MDI/MDIX auto detection, so you don't need to use crossover wires. Furthermore, the EKI-2741 accepts a wide voltage range from 12 ~ 48 V_{DC}. Besides, it also provides 3,000 V_{DC} surge (EFT) protection against over-voltage, so it is suitable for harsh operating environments.

EKI-2741 is an enhanced gigabit Ethernet to fiber optic converter. Aside from its standard features, the versatile the EKI-2741 also has the LFP (Link Fault Pass-through) feature. When one side of the link fails, the other side continues transmitting packets, and waiting for a response that never arrives from the disconnected side. EKI-2741 will force the link to shut down as soon as noticed that the other link has failed, giving the application software a chance to react to the situation.

Introduction

EKI-1331 cellular gateways can transparently bring RS-232/485 or Ethernet devices to a cellular network. They allow nearly any device with serial or Ethernet ports to connect and share a cellular network with easy and simple configuration. EKI-1331 cellular IP Gateway's are compact, and can be DIN-rail or wall mounted and with front panel LED displays for easy identification. They come with DC power input from 12-24 V_{DC} and have 2 KV EFT/Surge protection to prevent damage from various type of power resources. Introduction

The EKI-1200 series Modbus gateways are bi-directional gateways for integrating new and existing Modbus/RTU and Modbus/ASCII serial devices to newer TCP/IP networked-based devices. The EKI-1221/1222/1224 feature two independent Ethernet ports and MAC addresses to provide a redundant networking mechanism to guarantee Ethernet networking reliability. They provide a simple and cost-effective way to bring the advantage of remote management and data accessibility to thousand of devices that can not connect to a network. The EKI-1221/1222/1224 provide a feature that can allow users to select master or slave operation mode for each serial port. They not only allow an Ethernet master to control serial slaves, but also allow serial masters to control Ethernet slaves.

Introduction

EKI-1361 and EKI-1362 wireless serial device servers bring RS-232/422/485 to wireless LAN or LAN. They allow nearly any device with serial ports to connect and share an WLAN network. EKI-1361 and EKI-1362 provide a quick, simple and cost-effective way to bring the advantages of remote management and data accessibility to thousands of devices that cannot connect to a network.

With EKI-1361 and EKI-1362, your existing serial devices can be used with the most popular operating systems on the market. There is no need to write special drivers for specific operating systems. Moreover, you can make serial devices communicate with other devices peer-to-peer, without any intermediate host PCs and software programming. That saves a lot of cost and effort. In addition, you can actively request data or issue commands from the RS-232/422/485 side or wireless LAN side. This data can be sent bilaterally. Thus, the EKI-1361 and EKI-1362 are especially suitable for remote monitoring environments such as security systems, factory automaton, SCADA, transportation and more.

Introduction

EKI-1521, EKI-1522 and EKI-1524 feature two independent Ethernet ports and MAC addresses to provide a redundant network mechanism to guarantee Ethernet network reliability. EKI-1521, EKI-1522 and EKI-1524 are serial device servers that connect RS-232/422/485 serial devices, such as PLC, meters, sensors, and barcode reader to an IP-based Ethernet LAN. They allow nearly any device with serial ports to connect and share an Ethernet network. EKI-1521, EKI-1522 and EKI-1524 provide various operations: COM port redirection (Virtual COMport), TCP Server, TCP Client and UDP mode. With COM port redirection mode, standard serial operation calls are transparently redirected to the EKI-1521, EKI-1522 and EKI-1524, guaranteeing compatibility with legacy serial devices and enabling backward compatibility with existing software. With TCP server, TCP client, and UDP modes, EKI-1521, EKI-1522 and EKI-1524 ensure the compatibility of network software that uses a standard network API. Moreover, you can make serial devices communicate with other devices peer-to-peer, without any intermediate host PCs and software programming.

Introduction

The EKI-1528 and EKI-1526 are industrial-grade network-based serial device servers for connecting up to 8 or 16 serial RS-232/422/485 devices, such as CNCs, PLCs, scales and scanners, directly to a TCP/IP network. The EKI-1528 and EKI-1526 feature two independent Ethernet ports and MAC addresses to provide a redundant network mechanism to guarantee Ethernet network reliability. The EKI-1528 and EKI-1526 provide a simple and cost-effective way to bring the advantages of remote management and data accessibility to thousand of devices that can't connect to an Ethernet network. The EKI-1528 and EKI-1526 offer multiple ways to configure through Windows utility, Web Browser, serial console or Telnet console, these methods make it easy manage many EKI-1528 and EKI-1526 or serial devices on your network.

PRODUCT FEATURES

- Future-proof network equipment
- Available in SM, MM fiber types
- Maximize network hardware
- Troubleshooting diagnostics
- Plug-and-play operation

SFP modules are compact transceivers that function as modular connectors. Available for all common fiber modes, wavelengths and data rates, these modules allow network operators to connect different interface types to the same network equipment via an SFP port. The cost of cable upgrades is greatly reduced preserving the networking equipment investment – all for the price of a relatively inexpensive SFP.

More and more network equipment is being designed with SFP ports to take advantage of the inherent flexibility and to eliminate the guesswork and uncertainty of expensive equipment purchases. All SFP modules from Advantech B+B SmartWorx carry a limited lifetime warranty.

ORDERING INFORMATION
